ENVIRONMENTAL ASSESSMENT BOARD
ONTARIO HYDRO DEMAND/SUPPLY PLAN HEARING

IN THE MATTER OF the Environmental Assessment Act,
R.S.O. 1980, c. 140, as amended, and Regulations
thereunder;

AND IN THE MATTER OF an undertaking by Ontario Hydro
consisting of a program in respect of activities
associated with meeting future electricity
requirements in Ontario.

Held on the 5th Floor, 2200
Yonge Street, Toronto, Ontario,
on Thursday, the 30th day of May,
1991, commencing at 10:00 a.m.

RONALD TABOREK,
DAVID BARRIE,
JOHN KENNETH SNELSON,
JUDITH RYAN; Resumed 3767

Cross-Examination by Mr. Shepherd (cont'd) 3767

1 ---Upon commencing at 10:02 a.m.

2 THE CHAIRMAN: As you probably know, next
3 week we will sit Monday, Tuesday, Wednesday, but on
4 Thursday, there is a trip to Darlington and so there
5 will be no sitting here on Thursday, for those who are
6 making their plans.

7 Mr. Shepherd.

8 MR. SHEPHERD: Thank you, Mr. Chairman.

9 RONALD TABOREK,
10 DAVID BARRIE,
JOHN KENNETH SNELSON,
11 JUDITH RYAN; Resumed.

12 CROSS-EXAMINATION BY MR. SHEPHERD (continued):

13 Q. Let me just deal with a couple of
14 matters of clarification from yesterday afternoon --

15 THE CHAIRMAN: Mr. Shepherd, could you
16 move your microphone a little closer. I think some
17 people are having a little trouble hearing you.

18 MR. SHEPHERD: I have a tendency to be a
19 bit of a mumblor.

20 Q. First, Mr. Barrie, you talked about
21 the locked-in energy problem at Bruce yesterday. And I
22 wonder, as I understand it, you now only have a
23 locked-in energy problem if you have transmission
24 outages, right, especially on the 500 kV line?

25 MR. BARRIE: A. We expect that to be the

1 case, yes.

2 Q. I wonder if you could provide us with
3 the forced outage rate of the Bruce transmission
4 facilities and indeed perhaps you could give us a table
5 of, let's say, the last five years' forced outage rates
6 for 500 kV facilities. Is that something that you can
7 get together?

8 A. Would you like it for just the Bruce
9 to Milton 500 kV, they are the ones that have only just
10 gone in so we won't have any statistics on that or in
11 general for 500 kV.

12 Q. It probably would be more useful to
13 have a general 500 kV forced outage rate and if you
14 could break out the Bruce line that would be useful
15 too. I am just trying to get a sense of what the
16 problem now is, if there is one.

17 A. I think we can get that information.

18 Q. I would appreciate it. Should we get
19 a number for that?

20 THE CHAIRMAN: Yes. 142...

21 MR. BARRIE: Could I just be clear, Mr.
22 Shepherd, so that I get exactly what it is you want.

23 The line can be out either on a forced
24 outage or on a planned outage. You would like it
25 split?

1 MR. SHEPHERD: Q. Yes. Perhaps the
2 easiest thing to say is you could do a chart of
3 reliability indices for 500 kV splitting out the Bruce
4 line, couldn't you, for, let's say, the last five
5 years. Is that something that the information is
6 available for?

7 MR. BARRIE: A. I think it is.

8 Q. That would be the perfect set of
9 information. Thanks.

10 MRS. FORMUSA: That is 142.52.

11 MR. SHEPHERD: Q. And the other thing.
12 Mr. Snelson, we were talking yesterday about heat
13 rates, mainly with Mr. Barrie, but at the end of it we
14 talked about the extent to which heat rates and the
15 variability of heat rates are included in LMSTM, and
16 you indicated that you have some sort of calculation of
17 a figure to put in LMSTM. I wonder if you could give
18 us, tell us how that calculation is made. Perhaps just
19 provide us with the calculation to show us how it was
20 done.

21 MR. SNELSON: A. We can provide you the
22 derivation of the heat rates that are used in LMSTM.
23 That may entail a little time to dig material out from
24 the files and so on.

25 Q. There is no rush.

1 A. So, it is not necessarily a
2 straightforward matter, but it can be done.

3 Q. I would appreciate that.

4 And that is .53, Mr. Chairman.

5 THE CHAIRMAN: 142.53.

6 MR. SHEPHERD: Yes.

7 Q. Now, when we left off yesterday
8 afternoon, we were talking about load following by
9 generation types. Do you, Mr. Barrie, or anybody on
10 the panel I guess, do you have any projections over the
11 DSP period of the extent to which you expect demands
12 side management and/or non-utility generation to follow
13 load?

14 MR. SNELSON: A. There are assumptions
15 that are made that are included in the LMSTM data. And
16 beyond that degree of detail, which you already have, I
17 believe, in answer to interrogatories, I am not aware
18 of any more detailed predictions.

19 Q. So, it is in your avoided cost
20 calculation methodology, right, which is LMSTM?

21 A. LMSTM is the system energy production
22 cost model which is used for total system cost
23 simulations and is also used as one of the tools in
24 developing avoided costs.

25 Q. But it isn't in the models you use to

1 calculate the overall reliability of the system or
2 reserve margins or things like that?

3 A. The degree to which these reduce
4 primary load is included in the frequency and duration
5 model. The frequency and duration model has load
6 shapes which I believe are load shapes of primary load.
7 And so, to that extent, they are reduced by demand
8 management and load displacement non-utility
9 generation.

10 Q. And the primary load numbers, are
11 they set out in the frequency and duration model in the
12 chronological load curve that we saw the other day?

13 A. The frequency and duration model has
14 a load model that has in it a typical daily load shape
15 for three different day types for 12 months. So,
16 that's weekdays, Saturdays, and Sundays, and a peak
17 load duration curve that is used to scale the load
18 shape up and down according to the load level predicted
19 for that day. So, that is the degree of definition of
20 load that is in there.

21 Q. Now as I understand it, the daily
22 load curve is calculated from the basic load forecast,
23 right; that is, you are going from the basic data
24 without including any impact of program-driven DSM or
25 for that matter load following NUGs?

1 A. The load shapes of primary load that
2 are in F&D will have been adjusted to be consistent
3 with the load forecast, and the load forecast is both
4 the forecast of basic load and of primary load, so the
5 load shapes will be adjusted to be consistent with the
6 forecasted primary load.

7 Q. I guess the thing I don't understand
8 from your answer is - and maybe I'm just being dense,
9 it's early yet - is the impact, the load following
10 impact of demand side management or load following
11 non-utility generation reflected in F&D?

12 A. It is reflected in F&D to the degree
13 that there is a different reduction in peak load than
14 there is a reduction in average load.

15 Q. And do you believe that that fully
16 reflects then this impact or is it sort of a short-cut?

17 A. This is we believe the appropriate
18 degree of detail for determining the impact on system
19 reliability. And then the F&D model, frequency and
20 duration model, is a model which is used for
21 reliability evaluations.

22 Q. So, you believe then that load
23 following is properly reflected in F&D.

24 A. We have made an appropriate amount of
25 adjustment I believe.

1 Q. Now, Mr. Barrie, just continuing on
2 with load following, but I want to deal with it from an
3 operational point of view. If you have load following
4 options that you know about that are fairly
5 predictable, how do you deal with those operationally
6 in your day-to-day dispatching of the system?

7 MR. BARRIE: A. If we had demand
8 management for instance.

9 Q. Yes. As the amount of load following
10 demand management changes, for example, does that
11 impact on how you dispatch the system on a practical
12 basis?

13 A. Operationally that would be -- to us
14 demand management just means that the load curve that
15 has to be met will be altered. It is invisible to us
16 how it happens. So, yes it would be factored in in
17 terms of a change load curve that had to be met.

18 Q. What about load following NUGs. How
19 would you deal with that operationally?

20 A. I am having to speak hypothetically
21 because we don't have any at the moment.

22 Q. You don't have any load following
23 NUGs at the moment?

24 A. Not to my knowledge.

25 Nearly all of our NUGs are load

1 displacement NUGs so we don't see it anyway. So, we
2 would only be talking about NUGs that are selling to
3 us. There is very little of that at all and that which
4 we do have tends to be fairly flat.

5 So, in any event, if I could just say how
6 we would handle it. It would have to be factored into
7 the generation schedule plan that I talked about in my
8 direct evidence, where we do factor in all sources of
9 generation. So, if we had a source of NUGs that we
10 knew reliably followed the load, then it would be
11 factored into that part of the generation schedule
12 plan.

13
14
15
16
17
18
19
20
21
22
23
24
25 ...

1 [10:15 a.m.] MR. SNELSON: A. Can we distinguish
2 between load following and dispatchability, because I
3 think they are quite different concepts although
4 related.

5 Q. In fact, I think that's the whole
6 point of this line of questioning. But please, yes,
7 go ahead.

8 A. The load following or you are
9 describing a tendency to follow load, dispatchability
10 is something quite different in that dispatchability is
11 the ability of the control centre to make decisions as
12 to when to schedule generation. So, a load following
13 characteristic is not dispatchability, but it may
14 change the amount of dispatching that has to be done on
15 the system.

16 Q. We talked all through Panel 1 about
17 exogenous factors, and it sounds to me like if you have
18 load following NUGs, for example, because they are not
19 dispatchable in that sense that you are talking about,
20 they are a type of exogenous factor, almost like having
21 a different load shape for the day, isn't that right,
22 that you have to deal with?

23 MR. BARRIE: A. Yes, the remaining
24 generation has to be the load that's left.

25 Q. Am I right in assuming that it is

1 harder to run the system, it's harder to dispatch when
2 you have more exogenous factors to deal with,
3 variations in load, variations in non-controllable
4 generation, things like that?

5 A. I think it would be another variable
6 that we have to cope with. So, to that extent, yes.

7 Q. And as your generation system relies
8 more heavily on demand side management, especially
9 program-driven demand side management and non-utility
10 generation, presumably that operational constraint, if
11 you like, making it more difficult to operate, is
12 increased?

13 A. I think that's fair to say, yes.

14 MR. SNELSON: A. I think that if these
15 things are totally random, yes. But, if there are
16 natural tendencies for some of the exogenous factors,
17 as you were describing yesterday, to be beneficial,
18 then it wouldn't necessarily make things more
19 difficult. So, for instance, I don't think that we
20 would accept that demand management necessarily makes
21 the dispatching problems of the system worse. As we
22 discussed yesterday, there may be a tendency for the
23 demand management savings to be correlated with load,
24 and to the extent that that tends to reduce variability
25 in the net, load that has to be supplied by our system,

1 then that would tend to reduce operational problems
2 rather than to increase them.

3 Q. And that's true of load-following
4 NUGs as well, they are predictable, reasonably
5 predictable?

6 A. That could be true of load-following
7 NUGs, if we have any, yes.

8 Q. I would like to turn now to the area
9 of reliability. Just come back right to the very basic
10 principles. As I understand the DSP, the two really
11 driving forces behind Hydro's planning and, indeed, all
12 of your operational decision-making, are cost and
13 reliability. And I understand that there are a lot of
14 other things as well, but those are the main ones,
15 right?

16 A. I think that you cannot ignore the
17 other factors. The other factors such as environmental
18 acceptability and social acceptability are, to some
19 extent, more important than the other two factors.

20 Q. I am not trying to catch you out.

21 A. No, I realize that. But reliability
22 and cost are important, but they are only two of a
23 number of important factors.

24 Q. Am I right, and we tried to find out
25 whether this was actually true and we couldn't nail it

1 right down, but am I right, do you know whether, in
2 fact, Ontario Hydro is the single most reliable utility
3 in the world, large utility, say?

4 A. I have no knowledge of that.

5 Q. Mr. Barrie, Mr. Taborek, do you know
6 where you stand in the scheme of things in term of
7 reliability?

8 MR. BARRIE: A. I know of some results
9 of CIGRE which is in the national group which does do
10 comparisons of this nature. I don't think I can quote
11 exactly where we are in the batting order, so to speak.
12 We are towards the upper end. I don't think we are the
13 most reliable, though.

14 Q. No. You're right up there?

15 A. But, first of all, let me clarify
16 right away. Nearly all of the numbers that we read off
17 those reliability reports that get assembled under
18 CIGRE, the vast majority of unreliability events being
19 reported are transmission related. And as such, as we
20 pointed out on numerous occasions here, transmission is
21 an issue but it's not what we are essentially talking
22 about when we are talking about generation reserve
23 margins and that kind of thing.

24 Q. Yes.

25 DR. CONNELL: Excuse me, what is the

1 source you are citing, Mr. Barrie?

2 MR. BARRIE: CIDGRE.

3 MR. SNELSON: I can tell you what it
4 stands for, it's in French. It's Conference
5 International de Grand Reseaux Electrique, which means,
6 roughly translated, it's the International Conference
7 on Large Electricity Systems.

8 DR. CONNELL: What came after "Grand"?

9 MR. SNELSON: Grand Resaux, reasons.

10 DR. CONNELL: Network.

11 MR. SNELSON: R-E-S-A-U-X, I think is how
12 it's spelled, but my French is...

13 DR. CONNELL: R-E-S-E-A-U would be
14 network, or system.

15 MR. SNELSON: R-E-S-E-A-U-X, I think it
16 is, E-A-U-X. My French spelling isn't as good as my
17 English spelling and my English spelling isn't that
18 good enough either.

19 So, it's the International Conference on
20 Large Electricity Systems. It's a group that covers a
21 large proportion of Western Europe and North America,
22 Japan. I don't believe that it includes the eastern
23 European countries.

24 DR. CONNELL: Thank you.

25 MR. SHEPHERD: Q. Let me come back to

1 what you just mentioned, that you are concentrating on
2 generation reliability for the purpose of things like
3 reserve margin, correct?

4 Do I get a sense, from what you are
5 saying, that in your comparison of generation
6 reliability as between Ontario Hydro and other
7 utilities, you are not as good?

8 MR. BARRIE: A. I don't know. I don't
9 have that comparison. All I am saying is the
10 comparison of overall reliability experienced by
11 utilities, and that was what my comment was based on.

12 Q. And on that score Ontario Hydro is
13 really good?

14 A. Yes.

15 MR. TABOREK: A. I can perhaps give you
16 some statistics that are one step removed from
17 reliability. I believe I have some actual margins that
18 a number of utilities in Europe have right now, had in
19 '80 and had in '88.

20 Q. Reserve margins you mean?

21 A. Yes.

22 Q. And these are actuals, so they would
23 have to be compared with our actuals. But, for
24 instance, in 1989, Spain had a 32 per cent reserve
25 margin; Norway had 33; Netherlands, 26; Turkey, 46;

1 Austria, 45; Ireland, 28. I have read about half of
2 them off the table and those are the high ones. And so
3 I would expect, all other things being equal, a higher
4 reserve margin--

5 Q. Actual reserve margin.

6 A. --would tend to incline towards
7 better reliability, but all other things aren't equal,
8 of course. But that would be an indication that we
9 probably wouldn't be among the highest.

10 Q. Of course, that would just speak to
11 generation reliability, right?

12 A. Yes. And this is a generation
13 hearing, yes.

14 And I know Japanese, at least one
15 Japanese utility that we have had a chance to speak to
16 would not consider cutting interruptible loads as an
17 energy measure. So, I wouldn't be able to support that
18 we are the most reliable, not with what I know.

19 Q. All right. When you are dealing with
20 reliability of a particular unit, as I understand your
21 earlier testimony, the key number is forced outage,
22 that's the one that really counts from the point of
23 view of reliability?

24 A. Yes.

25 Q. And you were talking about the

1 acronyms DAFOR and DAUFOP. Is that how you say it,
2 DAUFOP.

3 A. Yes.

4 Q. Those are the two acronyms that you
5 used to describe forced outage. Force outages don't
6 just include simple breakdowns, right? That's one
7 thing that's included in forced outage, the thing
8 breaks and isn't working. There are other things that
9 are included in forced outages?

10 A. For example, what do you mean?

11 Q. Well, for example, if you are on a
12 maintenance outage and you have to extend it, that's a
13 forced outage; isn't it?

14 MR. SNELSON: A. That is considered to
15 be forced extension of a planned outage, and that is
16 one of the factors accounted for in DAFOR or DAUFOP.

17 Q. Okay. And so, does that mean, for
18 example, if you planned to spend 18 months on a fuel
19 channel removal and it took 22 months, the first 18
20 months would be a maintenance outage and the last four
21 months would be DAFOR?

22 A. The first 18 months would be a
23 planned outage.

24 Q. Sorry, yes.

25 A. And any extension would be

1 considered -- if it was not discretionary, so if it was
2 not the result of a conscious decision to extend it
3 because there was some additional work that needed to
4 be done, and, you know, you could have brought it back
5 into service, if it was not discretionary, it would be
6 considered to be forced and would become part of the
7 DAFOR and DAUFOP.

...

1 [10:25 a.m.] Q. Well, let me just take that other
2 example then. Let's say, you were doing the fuel
3 channel removal, and you could, in fact, finish it
4 after 18 months, but you find that there is also some
5 problems with the calandria tubes, so you have to fix
6 those, too, and that takes some extra time. Is that a
7 forced outage?

8 A. If you could have deferred the
9 calandria tube work to another year and you chose to do
10 it this year, it would be planned. If the unit could
11 not have been returned to service because the calandria
12 tubes had some faults in them that needed fixing before
13 they could be returned to service, then that would be
14 considered forced.

15 Q. Now, there is no consideration of the
16 economic impacts of putting it back in service or not,
17 in terms of whether you are forced to do the work,
18 right? That is, it can be very expensive to put it
19 back in service and then six months later take it out
20 again, to fix the calandria tubes, for example. That
21 expense isn't considered in whether it is forced?

22 A. That is not considered in whether it
23 is forced, but it is considered in choosing the time to
24 do a planned outage.

25 Q. Of course. I'm just going to ask you

1 to look at this supplementary information of 2.14.5
2 which have provided to you. I couldn't actually find
3 the cover page on 2.14.5, but I don't think it is a
4 problem.

5 What I'd like you to do is turn to the
6 letter from Mr. Franklin to...

7 THE CHAIRMAN: I am sorry?

8 MR. SHEPHARD: It actually looks like a
9 letter from Mrs. Formusa, because that is how I got it.

10 THE CHAIRMAN: 2.4.15.

11 MR. SHEPHARD: 2.14.5. It should be next
12 on your pile, Mr. Chairman.

13 MS. PATTERSON: Dated May 7, 1990.

14 MR. SHEPHARD: The letter is dated May 7,
15 yes.

16 THE CHAIRMAN: Go ahead.

17 MR. SHEPHARD: Q. On the third page of
18 that is a letter to the then Minister of Energy from
19 the president, the then president of Ontario Hydro.
20 And just looking at the description of -- this is a
21 description of the problems you had in December 1989?

22 MR. BARRIE: A. Yes.

23 Q. Is that correct?

24 Just looking at that description through,
25 for example, the last paragraph on the first page, it

1 appears that forced outages associated with extensions
2 to planned outages were a major part of the problem
3 then, is that right?

4 A. That was a part of the problem, yes.

5 Q. If you look at the second page, let
6 me just find the reference here, in the bottom
7 paragraph of the second page, Mr. Franklin is trying to
8 explain to the Minister the sorts of factors that could
9 cause the problem to recur. And he refers to, in the
10 third line of the last paragraph, "failure of
11 generating units at Bruce and Pickering to return to
12 service from outages on time." That again, that would
13 be treated as forced outage, right?

14 A. In this case it would be.

15 Q. Now, do forced outages also include
16 situations where you have to advance planned or
17 maintenance outages when you don't want to? For
18 example, you had a problem with pressure tubes.
19 Instead of replacing them after 30 years, you had to
20 replace them after what, 13 years or something at
21 Pickering? That is a forced outage, right?

22 A. Pressure tubes...

23 MR. SNELSON: A. The first major
24 pressure tube replacement, which was Pickering Units 1
25 and 2, occurred because there was a rupture in one of

1 the units, and that and its similar unit had to be
2 taken out of service, in the case of the damaged unit,
3 to repair it; in the case of the undamaged unit,
4 because there was a significant probability the same
5 problem might recur, and we wanted to avoid that
6 problem recurring.

7 Those outages, which I think we have
8 already dealt with, were in the order of three to five
9 years for those two units, were considered to be forced
10 outages, and they are in the forced outage data, which
11 Mr. Taborek has shown.

12 The definition of a planned outage is an
13 outage that can be deferred to the next season or
14 beyond, and the subsequent retubing outages, Pickering
15 Units 3 and 4, and proposed retubing outages at some of
16 the Bruce units, which are being done on a planned
17 basis, can be deferred by a year or more, one way or
18 another, and are considered to be planned outages.

19 Q. And the reason for that, if I
20 understand it correctly, is from a reliability point of
21 view, you don't have to worry that tomorrow you won't
22 have that unit, because you know when you won't have
23 that unit. So, you are planning for it in advance?

24 A. Normally, planned outages are
25 scheduled for periods when they will have little effect

1 on the system reliability. Retubing outages, which are
2 a year or longer and therefore it is necessary that the
3 units be out through at least one winter peak and maybe
4 two winter peaks, then they are accounted for in our
5 reliability calculation by actually taking out the
6 units that are on planned maintenance, or for winter
7 peak periods in evaluating system reliability. So,
8 they are accounted for.

9 Q. I realize that. So, normally, a
10 planned outage would not really be a reliability
11 problem, right? If you had a planned outage of a
12 month, and you could put it in September, it is not a
13 reliability problem.

14 A. It is a very small influence on
15 reliability, because the probability of being a
16 reliability problem in September is a lot smaller than
17 in December.

18 One does have to be concerned about the
19 volume of planned outages and whether that can, in
20 fact, cause reliability problems to be as significant
21 during lower load periods when you are doing planned
22 maintenance, as it would be in high load periods when
23 you are not doing planned maintenance.

24 Q. But longer planned outages, like
25 pressure tubes, for example, amid anything that is more

1 than a year, I guess, while not as bad as forced
2 outages, still have a much bigger relative impact on
3 reliability, is that right?

4 A. They have the impact of losing the
5 unit for that period. And that is accounted for.

6 Q. What about if you can't use a coal
7 unit because of acid gas limits. You reach your limits
8 and you just can't use it because you would be over
9 your limits. Is that a forced outage?

10 A. I think it is a very unlikely
11 situation that we would get ourselves into that
12 situation. It is a situation which, in the operation
13 of the system, the system is operated to try and avoid
14 that sort of circumstance.

15 Q. But, Mr. Snelson, I didn't ask you
16 whether it was going to happen. I'm just working on
17 the definition of DAFOR.

18 A. It never has happened, and where
19 I'm...

20 MR. BARRIE: A. It is not thought of as
21 a forced outage. It is an energy limitation on all of
22 fossil plant. The acid gas restriction is essentially
23 an energy limitation. It limits the total amount of
24 fossil you can produce in a year. So, as such, it is
25 not a forced outage.

1 So, at one instance, if we had a capacity
2 problem, we could put all of our fossil plant and run
3 it for a day. That would not impact the annual
4 emission target. So, as such, it is not a capacity
5 reliability problem in that sense.

6 Q. It is December 15, 1991, you are
7 already up to 280 gigagrams, and it turns cold. You
8 can't turn on the coal units. Is it a forced outage or
9 not? Is that going to be in the number?

10 A. In that dreadful circumstance that
11 you have just described, it would be. We would have
12 managed the system dreadfully to have got to that
13 point.

14 Q. So, it would be a forced outage, yes.

15 A. Under that particular circumstance
16 you just described, it would be. However, it would not
17 occur, because we would not manage the system that way.

18 Q. Fair enough.

19 THE CHAIRMAN: I'm just not sure of the
20 dividing line between what you call an energy
21 limitation or restraint and an outage, where do you
22 draw that line?

23 MR. BARRIE: Well, the energy limitation
24 puts a limit on how many times we could run the fossil
25 plant, how many terawatthours we could get from the

1 plant. So, we have to plan the year's production, so
2 that we stay within the acid gas restriction.

3 On any given day, that doesn't limit the
4 capacity, unless we get into the kind of situation that
5 Mr. Shepherd just described, where you were very close
6 to the limits, and you needed a lot of capacity.

7

17
18
19
20
21
22
23
24
25 ...

1 [10:35 a.m.] This is part of reason our strategy for
2 meeting the acid gas, during 1990 in particular when it
3 was limiting, was that we would tend to be lower than
4 the target throughout the early part of the year. We
5 had taken our control actions early so that we would
6 not, in fact, get in the position that you just
7 described.

8 MR. SHEPHERD: Q. And the reason for
9 that of course is that December is the month you are
10 most likely to need the coal; right?

11 MR. BARRIE: A. December is one of the
12 months that has the highest fossil burn, yes.

13 Q. This is totally an aside. But why
14 wouldn't you just go to the government and say,
15 "Listen, can we calculate our acid gas limits from
16 October 15 to October 15?"

17 MR. TABOREK: A. Simply that there is no
18 one time period exceptionally preferred over any other
19 and the decision was made to pick one and that is the
20 one that is being used. And we live with the pros and
21 cons of that.

22 Q. Now, if you have an oil-fired unit
23 and you run out of oil, you want to turn it on but
24 there is no oil in the tank, is that a forced outage?

25 MR. BARRIE: A. That falls into

1 basically the same situation as I described, where
2 again you have an energy limitation.

3 Q. But when it happens -- it did happen
4 in December of '89, didn't it? Was that included in
5 the forced outage of Lennox when it happened?

6 A. I am not sure. I am not sure how
7 that was classified in the after-the-fact reporting.

8 Q. Mr. Snelson, do you know whether that
9 was part of Lennox's forced outage?

10 MR. SNELSON: A. No, I don't, because
11 forced outage rates and so on are used both for system
12 purposes and for also for unit performance purposes.
13 And from a system point of view, what you have
14 described is a forced outage -- a forced problem.

15 Q. Yes.

16 MR. TABOREK: A. But it would not be
17 appropriate, for instance, to incorporate those
18 features in a reliability analysis, and we would not
19 propose, for instance, to build a new generating
20 station because Lennox ran out of fuel in one month.
21 We would just get fuel to Lennox.

22 The same with the acid gas. If we
23 experienced an acid gas problem, we would fix the acid
24 gas problem. We would not build another generating
25 unit of some kind to give a reserve margin.

1 Q. So, from your point of view you don't
2 think that should be treated as DAFOR -- or DAUFOP I
3 guess --

4 A. It shouldn't be included in the
5 reserve margins for the future system.

6 Q. And when you calculate the reserve
7 margins, you are essentially going from forced outage
8 rates to get there, aren't you?

9 A. Yes, that's right.

10 Q. So, if you included it in the forced
11 outage rates, then you get--

12 A. I would certainly take them out, yes.

13 Q. --the wrong reserve margin?

14 And what about if you have other
15 environmental problems stopping a unit. Let's just
16 hypothesize that the Ministry of the Environment comes
17 into Lakeview one day, says, "We don't like how you are
18 dealing with your fly ash. Close it until it is fixed.
19 Period. Just, now, close it." Is that a forced
20 outage?

21 MR. SNELSON: A. I don't know. It's
22 obviously unavailability of the plant, but how it would
23 be classified I don't know. We haven't had that
24 circumstance.

25 MR. TABOREK: A. That same comment with

1 respect to impact on future reserve margin.

2 MR. BARRIE: A. In general although when
3 with we derate a plant for whatever reason, we do take
4 account of that in our DAFORS, yes, in reporting that.
5 So, if we have a restriction because of emission
6 problems, that would be taken account of. But the
7 solution is to put that right, not to build extra
8 generation.

9 Q. I guess what I am trying to
10 understand is we have all of these charts of DAFOR and
11 DAUFOP, and I just want to know what is in the numbers,
12 what the concept is. It sounds like Mr. Taborek is
13 saying that the concept is if it's a technical
14 constraint, that is, if the thing breaks, and things
15 similar to that, then that's forced outage. It sounds
16 like you are saying though, anything that when you
17 flick the switch it doesn't come on, that's forced
18 outage.

19 MR. TABOREK: A. My comments are with
20 respect to the use of numbers for calculating the
21 required reserve margin on the existing system.

22 Q. So, then I take it, Mr. Barrie's
23 concept of if you flick the switch and it doesn't go
24 on, it is a forced outage.

25 A. Mr. Barrie is more expert at

1 categorizing these than I, yes.

2 MR. BARRIE: A. I was trying to give the
3 example of the environmental restriction. We would
4 certainly factor that into part of the forced outage.
5 We have had to derate units. During 1990, one of our
6 problems was derating some of the fossil plant because
7 of visible emissions. And when we did that, that was
8 factored into the forced outage rate, yes.

9 MR. SNELSON: A. That is an equipment
10 failure. The reason that the opacity limits were being
11 exceeded was because the precipitators were not working
12 properly. And that is a failure of the equipment. If
13 there isn't fuel in the Lennox oil tanks and Lennox is
14 therefore not able to operate, then all the equipment
15 at Lennox is operable. And I don't believe that would
16 be counted in the forced outage rate of the plant.

17 Q. I am confused then. I'm sorry.

18 I mean, forced outage rate must mean
19 something, right? I thought I just heard Mr. Barrie
20 say that if you expect it to turn on and it doesn't -
21 he didn't say this, but this was the concept I
22 understood - if you expect it to turn on and you can't
23 turn it on, it is forced outage. And I understand you
24 to be saying it is only the case if the equipment
25 doesn't work.

1 A. We can give you, I think, an
2 undertaking to give you exactly how these events were
3 classified. But, my understanding is that if it is a
4 problem with the equipment in the station, it will be
5 part of the forced outage rate of that station because
6 the station manager and people who design and operate
7 the station are measured against the forced outage rate
8 of their plant.

9 And if it's a problem with the fuel
10 supply, then that's something which the fuels division,
11 and people such as that, have to deal with.

12 But the environmental problems that led
13 the ratings, as I have said, were equipment problems.
14 It showed up as an environmental problem, but the
15 reason that it was not being met was because the
16 equipment was not working as it was designed to work.

17 Q. And that is not dissimilar from the
18 generator not working, the turbine not working?

19 A. That is very similar to not being
20 able to produce the power because there is only three
21 coal mills working instead of four, and so you can't
22 get all the coal into the boiler because the equipment
23 isn't working properly.

24 THE CHAIRMAN: What I am not entirely
25 clear of is whether DAFOR and DAUFOP mean the same to

1 everybody. Are there different criteria for operations
2 and for planning for those two? I would have thought
3 that they would be the same.

4 MR. SNELSON: They are the same and there
5 are fairly consistent definitions of many of these
6 factors throughout North America through a system
7 called GADS, which is Generation Availability Data
8 System.

9 THE CHAIRMAN: Well, I guess it's those
10 definitions that Mr. Shepherd is now exploring. And if
11 they are set out somewhere, perhaps that would be
12 helpful.

13 MR. SHEPHERD: That would be very
14 helpful, yes.

15 MR. BARRIE: Well, they are set out in
16 our standard OEB -- every year we give a definition of
17 all of these factors.

18 MR. SHEPHERD: Q. Well, Mr. Barrie,
19 that's true and I understand that. But you will agree,
20 I think, that all of these questions that I have just
21 been asking about, what is included and what is not,
22 those OEB definitions won't tell you those answers,
23 will they?

24 MR. BARRIE: A. Let me clarify. All
25 equipment-type failures as Mr. Snelson said which cause

1 when I flick a switch and ask for the power and it's
2 not available, if it is an equipment problem at the
3 station for whatever reason, if I either can't get the
4 unit or I can only get a part of the unit, it will go
5 against DAFOR. The only caveat I have that I am not
6 sure about is how we treated those energy-type
7 limitations.

8 Q. That is non-equipment reasons why it
9 doesn't work?

10 A. It is a non-equipment reason, and the
11 two examples we have are the shortage of oil at Lennox
12 where the machine was actually available and we could
13 have generated it, but we were running out of oil. Or
14 the acid gas, where if we had put the unit on we might
15 exceed our limit. They are not treated in DAFOR.

16 But, as Mr. Snelson said, we can
17 undertake to get exactly how they were treated in the
18 statistics.

19 Q. And similarly with the example of,
20 for example, a government body forcing you to shut
21 down a unit because you are doing something wrong,
22 which is not an equipment available, they just don't
23 like what you are doing --

24 A. Well, in the example we quoted about
25 the emissions, that would be an equipment failure, the

1 precipitators were not working properly, the Ministry
2 of the Environment ordered us to shut down, that would
3 be a DAFOR as well.

4 Q. But if, for example, in the Lakeview
5 example I gave you where you just have to deal with
6 your fly ash problem and you haven't yet, and the
7 Ministry of the Environment eventually gets annoyed and
8 says "Enough is enough, close it," that would not be
9 DAFOR?

10 A. I am not sure of that.

11 Q. Just one more example quite
12 different.

13 MS. PATTERSON: Do we have an undertaking
14 number? Is that .54.

15 MR. SHEPHERD: Yes.

16 MR. BARRIE: Can we clarify exactly what
17 it is we are giving in that undertaking.

18 MR. SHEPHERD: Q. My understanding of
19 what you are giving is a detailed summary of where you
20 draw the line between DAFOR and -- or forced outage and
21 not forced outage in the context of non-equipment
22 failures.

23 MR. BARRIE: A. Okay.

24 Q. Now what if you have technical or
25 other problems during the shakedown period for a unit.

1 The specific example, which is probably the easiest to
2 mind, is Darlington because it was supposed to be on
3 the line, what, a year ago? Two years ago? And it
4 keeps changing.

5 Now, when it has technical problems after
6 its in-service date, its proposed in-service date, but
7 before it is actually commissioned, is that DAFOR?

8 A. It is the actual in-service date that
9 is the critical thing here. When it is declared
10 in-service, any subsequent problems will go against
11 DAFOR.

12 Q. But any problems you have before it's
13 commissioned --

14 A. Well, it is being commissioned then.
15 A unit being commissioned, naturally, is subject to
16 more outages. In fact, we don't even count on it at
17 the control centre. When we are getting power from a
18 commissioning unit, we know that it is inherently less
19 reliable until it is officially declared in-service,
20 and we, in fact, alter the way we treat that plant
21 during its commission.

22 Q. So, the variability and the
23 reliability of a particular technology, say, or a
24 particular unit from -- let me rephrase this.

25 There is a fairly predictable pattern of

1 problems that you will have during commissioning,
2 right, that's the whole point of having a shakedown
3 period?

4 A. The unit during commissioning will
5 not be as reliable we expect as it will be when it is
6 steady operation, yes.

7 Q. And in a case of something for
8 example like Darlington where it has been far less
9 reliable, you keep having to put back the in-service
10 date because things keep breaking, you wouldn't treat
11 that difference as being a forced outage?

12 A. Unless it has been declared
13 in-service, it is not treated as part of DAFOR, yes.

14 THE CHAIRMAN: Excuse me. I thought
15 somebody said some time earlier that you estimated its
16 in-service date for your planning purposes, and then
17 moved around that with a 6-month margin. Now, you are
18 saying that you don't take into account until the
19 actual date. I am a little confused about that.

20 MR. SNELSON: I think both statements are
21 correct. DAFOR, as Mr. Barrie has said, does not
22 include the possibility that the actual in-service date
23 may be later than the planned in-service date.

24 For planning purposes, in the reliability
25 model, we have a factor called "in-service date

1 [10:50 a.m.] THE CHAIRMAN: What page, please?

2 MR. SHEPHERD: This is page 1 of the 1990
3 reliability indices.

4 THE CHAIRMAN: Exhibit 148?

5 MR. SHEPHERD: That's right. I'm sorry,
6 it's page 1 of the forward of that. So, it's not even
7 a numbered page, actually.

8 Q. Do you see where I am? If you look
9 at the third paragraph, the sixth line, it says:
10 "Stations with half the units commissioned at time the
11 forecast is prepared are considered to be in-service."
12 Is that something different?

13 MR. TABOREK: A. Allow me to clarify
14 that. That's with respect to the allocation of the
15 primary responsibility for making the forecasts. It's
16 not the definition that Mr. Barrie was talking about.

17 Q. All right, okay. Anyway, where I was
18 going was, if in the most extreme situation, it's
19 October 31st, you still believe that Darlington 1 is
20 going to come on in-service on November 1st, you are
21 scheduling tomorrow and you get a phone call, "No,
22 sorry, we are going to have to put it off another
23 month." I realize it's very extreme, but in that
24 situation that is not DAFOR; is it?

25 MR. BARRIE: A. I don't think it is.

1 Q. I realize that would never happen.

2 A. Never say never. (laughter)

3 Q. Okay. Can you turn again to - I am
4 using 148, I didn't realize that - Exhibit 148, the
5 1990 reliability indices, page 19. What I would like
6 to do is talk for a minute about the forced outage
7 rates you are using for --

8 THE CHAIRMAN: 19, so Table 14.

9 MR. SHEPHERD: Table 14, yes.

10 Q. I would like to talk just for a
11 minute about the DAFORs you are assuming for NUGs. If
12 I understand this correctly, the DAFOR you are assuming
13 for NUGs is 15 per cent; is that correct?

14 MR. TABOREK: A. Yes.

15 Q. And that's made up, if I read the
16 last three lines correctly, last two lines correctly,
17 of 5 per cent for real forced outages, which is sort of
18 like your definition of equipment failures, and 10 per
19 cent for something called steam process derating. Can
20 you explain what steam process derating is?

21 MR. SNELSON: A. I can give you the
22 first level of description, beyond that, as I say, you
23 can go to Panel 5 which is the non-utility generation
24 panel.

25 But, this is on the basis that most of

1 the non-utility generation that is in the non-utility
2 generation plan is cogeneration. And as I described
3 yesterday, cogeneration is usually operated in a mode
4 where the electrical energy production is as determined
5 by the steam demand. And the judgment is that the
6 electrical operation is usually somewhat lower than the
7 maximum amount of electricity that the facility could
8 produce, its maximum capacity, and that the 90 per cent
9 or the 10 per cent steam derating is an allowance for
10 the electrical production being a little bit lower than
11 the maximum because the steam demand is usually a
12 little bit lower than the maximum the facility was
13 designed to produce.

14 So, that's as far as I can take you.
15 Anymore detail of that would have to go to Panel 5.

16 Q. So, if I understand that correctly
17 then, you are assuming that if a cogenerator has a drop
18 in the demand for process heat, the electricity output
19 will go down the same amount?

20 A. It's not a drop in the demand for
21 process heat. It's assuming that he has built some
22 margins into his steam supply system such that his
23 steam demand is usually a little bit less than the
24 maximum the facility could produce, and that the
25 electricity demand would be correspondingly a little

1 bit less than the maximum electricity that the facility
2 could theoretically produce.

3 Q. That assumes, I guess, that the
4 thermal load and the electrical load are matched by the
5 cogenerator; correct?

6 A. More or less, yes.

7 Q. That's in fact true in the United
8 States; isn't it? It's very common in the United
9 States to have close matching of load?

10 A. This is where I think you would have
11 a more definitive answer from Panel 5.

12 Q. So, if I want to ask questions about
13 forced outage rates of non-utility generators, that
14 should all be Panel 5 questions?

15 A. Yes, I think we can deal with how the
16 non-utility generation is modelled in the overall
17 system reliability calculation, but the reason why the
18 availabilities are set, as described here, are better
19 dealt with by Panel 5.

20 Q. Do I understand that these numbers in
21 fact aren't even set by your group, the non-utility
22 generation division --

23 A. I'm sorry, I missed the question.

24 Q. Do I understand correctly that these
25 numbers are not produced, these numbers on Table 14,

1 are not produced by system planning, or indeed by the
2 operating division, they are produced by the NUG
3 division?

4 A. The way in which all of these numbers
5 in Exhibit 148 are produced is that the production of
6 the document is coordinated by system planning
7 division, but the most knowledgeable group on each type
8 of capacity contributes to that. So, the non-utility
9 generation numbers have been contributed by the
10 non-utility generation division, in discussion with
11 others.

12 Q. Okay. I am going to leave that
13 series of technical questions then on those things, but
14 I do have some clarifications that I would like to get
15 to.

16 If you could turn to the 1989 forecast
17 of reliability indices, which I believe is also part of
18 148; isn't it? Exhibit 148 is all three of those sets?

19 THE CHAIRMAN: It's the one dated March
20 1989?

21 MR. SHEPHERD: No, it's the one dated
22 March 1990, I think.

23 THE CHAIRMAN: Right.

24 MR. SHEPHERD: Q. And if you will turn
25 to page 22. As I read that, and I don't even actually

1 have it in front of me, but as I read it last night,
2 that says that your assumption then was a 10 per cent
3 forced outage rates for NUGs; is that correct?

4 MR. TABOREK: A. Yes.

5 Q. And I think it was you, Mr. Barrie,
6 who was asked last Thursday - and your transcript
7 reference for this is page 3221 - you were asked, do
8 you use a 10 per cent forced outage rate for NUGs and
9 you said yes; is that right? Or maybe it was you, Mr.
10 Taborek.

11 MR. BARRIE: A. I don't recall that.

12 MR. TABOREK: A. I do recall giving a
13 number of 10 per cent to one of the questioners.

14 Q. Was that wrong then?

15 A. No, there is the number.

16 Q. But that was the previous year's
17 number; wasn't it? Isn't your new number 15 per cent?

18 A. Yes. And I answered in respect to
19 what is in the F&D model and the F&D model has the 10
20 per cent number in it.

21 MR. SNELSON: A. Maybe Mr. Taborek can
22 just tell us which edition of the F&D model he is
23 talking about. Because I think if we were to redo
24 frequency and duration analysis now, it would be based
25 on the latest forecast.

1 MR. TABOREK: A. That's right.

2 Q. So, it would have 15 per cent?

3 MR. SNELSON: A. Previous predictions
4 using the F&D model.

5 MR. TABOREK: A. That's correct.

6 MR. SNELSON: A. The ones described in
7 87, the ones described in Exhibit 87 were the 10 per
8 cent.

9 Q. All right.

10 THE CHAIRMAN: Is it in 87?

11 MR. TABOREK: Yes. The F&D model that
12 was used to compute the work that was done in Exhibit
13 87 used a 10 per cent forced outage rate for NUGs, for
14 CTUs and NUGs.

15 THE CHAIRMAN: If you were doing 87 now,
16 you do 15 per cent; am I right?

17 MR. TABOREK: Yes.

18 MR. SHEPHERD: Q. Just help me out a bit
19 here. Will you turn to 2.14.30?

20 MR. TABOREK: A. Yes.

21 Q. And this may actually be a question
22 for Mr. Snelson. The last line of 2.14.30 says that
23 for avoided cost calculations you use a DAFOR of 5 per
24 cent for NUGs. It says, more recently, avoided cost
25 calculations have used a DAFOR for NUGs of 5 per cent.

1 MR. SNELSON: A. And that would be 5 per
2 cent relative to the expected amount of power being
3 produced at the time of peak load.

4 So, in terms of calculating the avoided
5 cost of a specific non-utility generator, then either
6 through the data he provided to us, or through data
7 that would perhaps be estimated by our non-utility
8 generation division, one or the other, then we would
9 have an estimate of the amount of power that was
10 expected to be produced and to be on line at the time
11 of peak load.

12 And, if the steam derating factor that we
13 talked about was significant, that would be accounted
14 for in the amount of power expected to be available at
15 the time of peak load, and at that point, the steam
16 derating is already accounted for if it's a factor in
17 that particular non-utility generator, and the
18 additional forced outage rate to account for in the
19 avoided cost calculation is on the equipment
20 unavailability which is reckoned as 5 per cent.

21 Q. So, this DAFOR here is a different
22 DAFOR than Mr. Taborek's DAFOR?

23 A. Mr. Taborek's DAFOR is relative to
24 the reported capacity of the non-utility generator as
25 in his contract, or whatever, that is reported to us

1 through the non-utility generation plan, and is used to
2 evaluate the reserve requirement for the system as a
3 whole.

4 When we are looking at the avoided cost
5 of a particular non-utility generator, then we are very
6 careful to make our evaluation of that non-utility
7 generator as specific and as accurate as we can make it
8 for that particular non-utility generator's
9 circumstances.

10 So, there are broad assumptions that may
11 be made for a system evaluation which more accurate
12 assumptions will be made for a specific evaluation of a
13 particular non-utility generator, given that you then
14 have more data to deal with and it is more appropriate
15 at that stage to do a more detailed calculation.

16 Q. Mr. Taborek, just looking at your
17 reliability calculations for a second, and reserve
18 margin calculations, is there an impact if, let's say,
19 two stations, whatever they are, have the same
20 capability factor but one has a much higher forced
21 outage rate and lower everything else, and the other
22 has a lower forced outage rate but more maintenance
23 outages and planned outages, et cetera. Would they
24 have different impacts on on how you calculate
25 reliability and reserve margin?

1 MR. TABOREK: A. Reliability --

2 Q. Sorry, reserve margin.

3 A. Reliability and reserve margin are
4 primarily impacted by the forced outage rate.

5 Q. So, if you have some like steam
6 process derating and you choose to treat it as a forced
7 outage rather than something else, then that will tend
8 to depress the reliability of NUGs; is that right?

9 MR. SNELSON: A. I think this is
10 somewhat similar to the long planned outage for the
11 nuclear plant that we have talked about. The important
12 factor is, will that capacity be available at about the
13 time of peak load, and we are talking about peak load
14 that could occur perhaps in any three of the winter
15 months, December, January, February.

16 If it was steam derating that only
17 occurred during the summer, then it would probably not
18 be impactive on reliability. If its steam derating
19 that occurs most of the time and is likely to occur
20 during the peak months, then it would be impactive.

21
22
23
24
25 ...

1 [11:05 a.m.] Q. I would like you to turn, if you
2 could, please, to Exhibit 161, which I gave you
3 yesterday. What I would like you to do is just look
4 at -- let's start with the back page. These are
5 the larger non-utility generators in California, as I
6 understand it.

7 Now when I look at the line that says EAF
8 CF, that is something fairly equivalent to capability
9 factor, isn't it? In the context of cogeneration unit
10 with ample fuel, that would be very similar to
11 capability factor, wouldn't it?

12 A. Does this document have a definition
13 of EAF on it? Other than CF? Is CF capacity factor?

14 Q. It is on the previous page. EAF is
15 equivalent availability factor and CF is capacity
16 factor.

17 A. I understand the common meaning of
18 capacity factor. What is puzzling me about this
19 exhibit is why there would be one column with-
20 equivalent availability factor and capacity factor, why
21 they would be the same thing.

22 Q. If you assume they are
23 non-dispatchable, then those two numbers would be
24 identical, wouldn't they?

25 A. From a power system point of view

1 perhaps, but maybe not from the equipment point of
2 view. The fact that a non-utility generator chooses
3 not to run to his full availability doesn't change the
4 availability factor of equipment.

5 Q. But from the utility's point of view,
6 the non-utility generator is an external source of
7 supply, so, he is either on or off it. He is either
8 there or he isn't.

9 A. As I said, from a system point of
10 view they may be the same thing.

11 I'm happy to discuss it in terms of
12 capacity factor, presuming that is what the definition
13 of the column is.

14 Q. I'm just looking down this list and
15 looking at the cogen facilities, because that is what
16 we are really talking about here. That is what your
17 chart is about, right, thermal NUGs is cogen?

18 A. Yes.

19 Q. So, just looking at the cogen
20 facilities, it looks like their capacity factors are
21 way, way above the sort of thing you are expecting for
22 NUGs in the Table 14 of the 1990 reliability indices.
23 You are expecting something around 80 per cent, right?

24 THE CHAIRMAN: Would it be 85?

25 MR. SHEPHARD: No, I think it would be

1 80. Because they also, in addition to the 15 per cent
2 forced outage rate, they also have a 5 per cent planned
3 outage rate.

4 THE CHAIRMAN: I thought it was ten and
5 five and fourteen.

6 MR. SHEPARD: That was in 1989. Then in
7 1990 they changed it to 15 and 5.

8 Q. Isn't that right, Mr. Snelson?

9 MR. SNELSON: A. You're back to Exhibit
10 148, 1990 report?

11 Q. 1990, page 19?

12 A. That is page 19, I believe.

13 Q. Yes.

14 A. The median incapability factor that
15 is shown there is 20 percent, which implies a
16 capability factor of 80 per cent.

17 Q. And capacity factor can't be more
18 than capability factor, can it?

19 A. Provided the definition of capacity
20 that you are measuring it against is the same, you are
21 correct.

22 Q. It is just mathematically impossible,
23 right?

24 A. Yes.

25 Q. Okay.

1 A. Provided the definition of capacity
2 as the same.

3 Q. So, with the one exception of a brand
4 new facility in the Mojave Desert, it looks to me like
5 all of the cogeneration facilities on this list are way
6 above that. Is that right?

7 A. These are your numbers, yes. I...

8 Q. Actually they are the California
9 Energy Commission's numbers, not mine.

10 A. I am not in a position to discuss the
11 relative magnitude of cogeneration facilities'
12 availability in the States versus here. As I have
13 said, the justification for the numbers that we have
14 given will be better addressed to Panel 5.

15 Q. So, you don't know anything about QFs
16 in the United States, do you?

17 A. It stands for qualifying facilities.

18 Q. But if I were asking you questions
19 about how you qualify and stuff, that--

20 A. No.

21 Q. --would be Panel 5, right?

22 A. Yes.

23 Q. Let me then, just before we leave the
24 question of forced outage rates, isn't it true that a
25 forced outage rate for a single unit of certain

1 capacity, if compared to the forced outage rate -- the
2 same forced outage rate for a lot of small units
3 totaling the same capacity, in the latter case you are
4 going to have a lot more reliability? Isn't that
5 right?

6 A. You are going to have more. I'm not
7 going to necessarily agree to a lot more, because that
8 depends on the ratios of unit sizes and system sizes.

9 Q. Fair enough. I'm going to ask you to
10 turn to Exhibit 162, and you have had a chance to read
11 this now?

12 A. I read it at home last night.

13 Q. I'm not going to quiz you on the
14 tables of numbers. However, I do want to look at the
15 graphs at the end, which, at least on my copy, are
16 numbered upside down.

17 I'm going to show you Mr. Marks' first
18 chart, which is an overhead. I think it is overhead
19 No. 13 of that package. It is also the fourth last
20 page of the exhibit we are talking about. It is
21 labeled "NUG reliability at 8 per cent forced outage."

22 All this shows, correct me if I'm wrong,
23 all this shows is the cumulative probability of
24 generation from twenty 44-megawatt NUGs totaling 880
25 megawatts, using the same forced outage rate as you

1 often used for nuclear eight per cent. And does that
2 look like it is the right answer, the cumulative
3 probability?

4 A. It looks generally right.

5 Q. Doesn't that show that when there is
6 an eight per cent chance that the nuclear unit isn't
7 producing power, there is almost a certainty that the
8 NUGs will be producing 704 megawatts?

9 A. In this particular, very artificial
10 example, yes.

11 Q. Why is it artificial?

12 A. Because you are comparing a
13 reliability of a system with one large unit, with a
14 system with 44 small units.

15 Q. Well, if you had a choice between
16 getting 880 megawatts from cogenerators or 880
17 megawatts from building another unit at Darlington,
18 wouldn't the comparison be accurate in terms of the
19 impact of the forced outage rates?

20 A. The factor that matters is the
21 reliability of the whole system, not necessarily the
22 reliability of the little piece that you add. So, you
23 are interested in the effect on the whole system and
24 not on just the addition.

25 Q. Well, we haven't done a chart of the

1 whole system, of course, but if you look at the last
2 page of Exhibit 162.

3 DR. CONNELL: Excuse me, Mr. Shepherd, I
4 don't think I follow the point with respect to -- what
5 does this say about the nuclear unit to which you are
6 drawing your comparison?

7 MR. SHEPHARD: Well, if you have a
8 nuclear unit that has an eight per cent forced outage
9 rate, then at any given time...

10 DR. CONNELL: That is purely
11 hypothetical, isn't it?

12 MR. SHEPHARD: It is their number.

13 DR. CONNELL: From what source?

14 MR. SHEPHARD: I think the 1990
15 reliability indices use a long-term forced outage rate
16 for nuclear of eight per cent. Isn't that correct?

17 MR. TABOREK: Near enough, yes.

18 MR. SHEPHARD: Yes. So, at any given
19 time, the whole 880 megawatts has an eight per cent
20 chance of not being there. I'm oversimplifying, but
21 that is basically it. Whereas, at any given time there
22 is a virtual certainty that 704 megawatts of the
23 equivalent NUGs will be there. You don't have to worry
24 about that amount. You do have to worry about above
25 that. But that 704 megawatts is virtually certain.

1 That is simply because of the probability
2 of more than one of them being off at once, and the
3 probability of two being off and three being off at the
4 same time, all with the same forced outage rate.

5 DR. CONNELL: You're asking the Panel to
6 draw some inference from that?

7 MR. SHEPHARD: I will be in a minute,
8 yes.

9 Q. So, Mr. Snelson, if you could look at
10 this last chart, which is graph 4 of Exhibit 162, the
11 last page of Exhibit 162, and what this does is it
12 compares a four-unit nuclear facility like Darlington
13 against an equivalent number of smaller NUGs. Same
14 binomial probability calculation, okay?

15 If I'm right, then the portion between
16 the two lines, that is below the black line and above
17 this crosshatched line, that portion is the NUG
18 reliability advantage. Is that a fair expression?

19 MR. SNELSON: A. In this extremely
20 artificial example, yes. I don't believe it has any
21 significance to the Ontario Hydro system.

22 Q. I will come back to that.

23 But then after you get to a 3320 megawatt
24 number, it is actually less likely that you are going
25 to have the NUGs, that much NUGs, than you are going to

1 have the nuclear unit, right?

2 A. In this artificial example, yes.

3 Q. But from 1760 megawatts, by my
4 calculations, to 3320 megawatts, you are more likely to
5 have the NUG capacity than you are the nuclear station?

6 A. In this artificial example, yes.

7 Q. Is it true that the more small NUGs
8 you have, the higher the amount of capacity you have
9 that is mathematically virtually certain on your
10 system? Did it take you the whole system-wide basis?

11 A. It is directionally true that more
12 small units will have a higher degree of reliability
13 than a few large units.

14 Q. What I'm trying to get at, though,
15 Mr. Snelson, is this notion that there may be, if you
16 have enough small units, then you may have a chunk of
17 capacity that has virtually no uncertainty that it is
18 going to be there. So small as to be unmeasurable?

19 A. If you take your first example, with
20 any combination of small units or large units that form
21 together into a system, then at whatever statistical
22 level of certainty you want to establish, there will be
23 some level at which you have a high degree of
24 confidence that you will always have that much
25 capacity. And that is true for both small units and

1 for large units, and the number will be slightly
2 different.

3 Q. Well, isn't it true that the -- that
4 if you use small units rather than large units, the
5 number is not slightly different, it is significantly
6 different? Isn't that true?

7 A. It is true that the number is
8 different, and whether it is significant or not, you
9 have to do the reliability calculations with the real
10 proportions of small units and large units that are in
11 the system to determine how big the difference is, and
12 whether, in fact, that is something that should be
13 considered to be significant.

14 Q. Do your operating models assume a
15 reliability advantage for NUGs? Do they assume that if
16 you have a lot of small units, you have more certainty
17 of having that power?

18 A. Yes.

19 MR. TABOREK: A. Excuse me, operating
20 model?

21 MR. SNELSON: A. The F&D model.

22 MR. TABOREK: A. F&D, reliability.

23 Q. Yes, the F&D model.

24 A. Yes.

25 MR. SNELSON: A. Yes.

1 Q. And from an operating point of view,
2 on a day-to-day basis, do you assume -- or you don't
3 have enough NUGs to assume it yet, but let's assume you
4 had 5,000 megawatts of NUGs. Would you then have to
5 make some sort of assumption as to their higher
6 reliability, in order to operate?

7 MR. BARRIE: A. Yes, we would have to.

8 Q. Sorry?

9 A. Yes.

10 Q. Are you aware of any utilities that
11 as a result of increases in the quantity of NUGs on
12 their systems, have been able to reduce their reserve
13 margins?

14
15
16
17
18
19
20
21
22
23
24
25 ...

1 [11:20 a.m.] A. I am not aware of it.

2 Q. Mr. Snelson?

3 MR. SNELSON: A. I am not aware of any,
4 but --

5 Q. It's Mr. Taborek's area. Have you
6 looked at that at all?

7 MR. TABOREK: No. I am not aware of any.

8 Q. You haven't looked at that at all,
9 you haven't looked at that question?

10 A. No, I have not investigated other
11 utilities' responses to the introduction of NUGs.

12 Q. Ontario Hydro does intend to
13 substantially increase the percentage of NUGs on the
14 system, doesn't it?

15 A. Yes.

16 Q. But as I understand what you are
17 saying, you haven't taken any steps to figure out what
18 that would do your reserve margin by comparing yourself
19 to other utilities?

20 A. We have taken steps to determine what
21 it would do to our reserve margin.

22 Q. But not by comparing yourself to
23 other utilities.

24 A. Correct.

25 Q. Although in all other aspects of your

1 reserve margin you have, in fact, compared yourself to
2 other utilities; isn't that correct?

3 A. No, not in all other aspects of our
4 reserve margin. What we did was compare the reserve
5 margin we had against other utilities and looked to
6 account for significant differences.

7 Q. Am I right in assuming that or in
8 concluding, I guess, that if the capacity factor
9 numbers that that we saw in that California Energy
10 Commission excerpt, if those are representative of
11 NUGs, just assume that hypothesis for a second, then
12 the capacity factors, the capability factors, if you
13 like, for NUGs, would be far superior to either nuclear
14 or fossil in your experience in Ontario?

15 MR. SNELSON: A. you are talking about
16 10 or 15 per cent unavailability.

17 Q. The averages look like somewhere
18 between 7 and 13, I think, actually.

19 A. I thought it was 15, but anyway. You
20 know what our unavailability forecasts are, they are in
21 148, for plant, and those are lower numbers than the
22 unavailability that we forecast for fossil and nuclear
23 plant. Though we have had years when nuclear units
24 have operated at capability factors in excess of 90 per
25 cent. So, generally, those are better availability

1 factors than we forecast.

2 Q. And if you look at the past history
3 of nuclear fossil, isn't it true that those
4 availability numbers are really very significantly
5 better than your past history, not to suggest that you
6 are going to repeat your past history, but if you just
7 make that comparison, it is a pretty big difference;
8 isn't it?

9 A. The unavailability is -- that is
10 quite a good unavailability -- no amount of
11 unavailability.

12 MR. SHEPHERD: Mr. Chairman, I am going
13 to turn to reserve margins now. I wonder if you want
14 to take the break early.

15 THE CHAIRMAN: Why don't we take the
16 break now and come back in fifteen minutes.

17 ---Recess at 11:25 a.m.

18 ---On resuming at 11:45 p.m.

19 MR. SHEPHERD: Q. Let me turn to reserve
20 margins. Is it right that you have different
21 appropriate reserve margins for different generation
22 technologies? Mr. Taborek?

23 THE CHAIRMAN: I'm sorry, I didn't hear
24 that question.

25 MR. TABOREK: Repeat your question,

1 please.

2 MR. SHEPHERD: Q. Different generation
3 technologies have associated with them different
4 appropriate reserve margins; is that correct?

5 MR. TABOREK: A. Where we compute a
6 system reserve margin and the system reserve margin
7 would be different if your system were made up of
8 technologies with different characteristics.

9 Q. You don't compute reserve margins
10 associated with individual options. Nuclear, for
11 example, what's the appropriate reserve margin for
12 nuclear?

13 A. Not for a system reserve margin.

14 Q. I recall - I don't remember where it
15 was - that somebody said that you use a 24 per cent
16 reserve margin for fossil, a 24 per cent reserve margin
17 for nuclear, and something else - I don't remember what
18 it was - for hydraulic, on your own system.

19 A. No, I don't recall ever saying that.
20 I don't know anyone else that would say that either.

21 MR. SNELSON: A. 24 per cent is the
22 estimate of system reserve margin of the Ontario Hydro
23 system as it will be in the sort of 2000 to 2005 time
24 period, taking into account the mix of technologies,
25 demand management, non-utility generation. Everything

1 that is captured in the frequency duration models as
2 described in Exhibit 87.

3 Q. I would like you to turn to Exhibit
4 160. This is entitled "Excerpts from Documentation for
5 the Delta Computer Program Set-up." Perhaps you could
6 just start by telling us us what the Delta computer
7 Program was or is.

8 A. The computer program that is being
9 referred to, being given the name Delta, was a program
10 that was used to calculate system incremental costs
11 which is a major determinant of avoided cost, prior to
12 the development of the Demand/Supply Plan.

13 Q. So, this was the precursor to LMSTM
14 in effect; is that right?

15 A. No.

16 Q. You used that for system incremental
17 costs before you used LMSTM for system incremental
18 costs. Or am I understanding that totally wrong?

19 A. To run the program called Delta, you
20 needed to have the results of an energy production
21 model. LMSTM is an energy production model. Delta was
22 really sort of a post-processor to an energy production
23 model.

24 Q. You are not using it anymore?

25 A. We don't use Delta now, no.

1 Q. You were using it in '88, weren't
2 you?

3 A. It was used up until the development
4 of the avoided costs that are shown, and the system
5 incremental costs that are shown in Demand/Supply Plan,
6 yes.

7 Q. I am not sure I understand. So, just
8 before you started to calculate the system incremental
9 costs for the Demand/Supply Plan, you changed to
10 something else.

11 A. Yes.

12 Q. So you didn't use Delta for the DSP?

13 A. During the development of the
14 Demand/Supply Plan, we changed our avoided cost
15 calculation to be based on a specific long-term plan,
16 namely Plan 15 of the Demand/Supply Plan. In that
17 process, we went from a somewhat general model, which
18 is described in this Delta program, to a more specific
19 calculation that is related to the specific program,
20 specific plan that is in the Demand/Supply Plan.

21 So, in going from one method to the
22 other, then we changed the programs at the same time to
23 be appropriate to the new method.

24 Q. I don't really want to get into the
25 avoided costs.

1 A. No, I think that's Panel 3.

2 Q. I just want to identify the...

3 If you look at the last page of this,
4 page 2 it's marked, this is an excerpt from the process
5 you go through to determine the avoided costs using
6 this model. And what it says under nuclear initial
7 run, it says "reserve requirement 27.7," which I
8 presume is per cent; and under coal, it says "reserve
9 requirement 21.03," I assume again per cent; and under
10 oil it says "reserve requirement 27."

11 So, is that the sort of thing I was
12 asking earlier, that is, separate reserve margins for
13 different generation technologies?

14 A. I don't know what you were asking
15 earlier. But I can tell you what this is.

16 Q. Okay, that would be good.

17 A. This is derived from an estimate of
18 the load meeting capability of an additional amount of
19 nuclear generation or fossil generation on the system.
20 So, this is an incremental effect on the system reserve
21 margin and it's a description really of the load
22 meeting capability of that particular type of capacity
23 as an addition to the system.

24 Q. So, is it fair to draw the inference
25 from it then that you need more nuclear to have the

1 same load meeting capability that coal?

2 A. With the data that went into
3 determining those load meeting capabilities, yes.

4 Q. Is that true today?

5 A. I believe it is.

6 Q. When you run your F&D model, is that
7 assumption implicit in it that you need more nuclear to
8 have the same load meeting capability as you would get
9 from coal?

10 A. The load meeting capability of the
11 generating unit is determined principally by the forced
12 outage rate of the unit, and to a lesser extent by the
13 unit size.

14 And the F&D model takes together all of
15 the units with their appropriate data and determines a
16 system reliability which is then used, as Mr. Taborek
17 described in his direct evidence, to determine an
18 appropriate reserve margin for the system as a whole.
19 So, you would never find in the F&D model an estimate
20 of the reserve requirement for any particular
21 generation. It calculates the effect of the whole
22 system.

23 But, because the units that go in have
24 different sorts of data, then you can infer that they
25 would have different incremental effects upon reserve

1 margin. It is not calculated.

2 Q. Let me simplify this just a bit. If
3 you take a look at these numbers from Delta, and I
4 understand those numbers aren't relevant today, they
5 just happen to be a good example, that's all, and you
6 look at the reserve requirement assumed for nuclear of
7 27.7 per cent, do I take it then that a thousand
8 megawatts of nuclear is assumed in this to be 823
9 megawatts of load meeting capability?

10 A. No. I don't believe so.

11 Q. Sorry, 723.

12 A. I think you have to be divide by
13 1.27.

14 Q. So, it is actually less then? No, it
15 is actually more, that's right.

16 A. Sorry, what number did you give me.

17 Q. Let me change the example. 1277
18 megawatts of capacity would be a thousand megawatts of
19 load meeting capability. That works; right?

20 A. Yes.

21 Q. Okay. I have this problem in U.S.
22 exchange, too.

23 And similarly in coal, then 1210
24 megawatts would have a thousand megawatt load meeting
25 capability; right?

1 A. Yes.

2 Q. And implicit in this then is a higher
3 incapability factor for nuclear than for coal; is that
4 correct?

5 A. Yes. And it may also be a slightly
6 larger unit size.

7 Q. All right. And that's back to that
8 small unit/large unit thing we were talking about
9 earlier. Is that the same concept?

10 A. Yes.

11 Q. Now, your new projections of
12 incapability factors for coal and for nuclear, in
13 general, is it now true that nuclear has a lower
14 incapability factor than coal? In your projections? I
15 don't want to go into the detail, although if we have
16 to we will, but is that sort of generally true?

17 MR. TABOREK: A. I would just check them
18 in the exhibit.

19

20

21

22

23

24

...

25

1 [11:55 a.m.] MR. SNELSON: A. For future units of
2 comparable size, the incapability of a 4 by 750
3 megawatt nuclear station is forecast to be 18 per cent
4 in the long run, and for 4 by 850 megawatts nuclear, it
5 is forecast to be 16-1/2 per cent. But the forced
6 outages are in the opposite relationship.

7 THE CHAIRMAN: Sorry, 4 times 750, what
8 did you say?

9 MR. SNELSON: Four times 750 megawatts
10 units.

11 THE CHAIRMAN: Of?

12 MR. SNELSON: Of coal, bituminous coal.
13 That's on page 27 of Exhibit 148, the most recent
14 version of Exhibit 148.

15 DR. CONNELL: This is CTUs, I take it.

16 MR. SNELSON: No, this is coal.

17 MR. TABOREK: These are large coal
18 generator stations.

19 MR. SNELSON: Large coal generating
20 plant. It is shown as having a median incapability
21 factor of 18 per cent in the long run. Four by 850
22 megawatt nuclear units, which is on Table 18, page 23
23 of the same report, is shown as having a median
24 inability of 16-1/2 per cent, which shows the nuclear
25 as having lower incapability than the coal.

1 As I said, the forced outages are in the
2 opposite way around; the nuclear is higher than the
3 coal.

4 THE CHAIRMAN: Do you have numbers for
5 the forced outages?

6 MR. SNELSON: Yes. The DAUFOP for the
7 coal-fired plant correspondingly is 5 per cent, and for
8 the nuclear plant it's shown as 8 per cent.

9 MR. SHEPHERD: Q. Now, of course, the
10 DSP doesn't have any coal units in it, does it.

11 MR. SNELSON: A. Case 15 doesn't.

12 Q. Okay. Fair. And if we were looking
13 at your projections for your existing coal units and
14 your existing nuclear units, Panel 2 is on existing
15 system and I am trying to keep it to that, isn't it
16 fair that you are expecting higher incapability and
17 higher forced outages in fossil and nuclear, on
18 average?

19 A. I haven't averaged it across the
20 system. I am sure there must be units that go one way
21 or the other. The data is all there in Exhibit 148.

22 Q. If that were true, let's assume it is
23 for now and we will get the calculations done, that
24 would suggest, if you were doing a calculation like
25 this, like in Delta, would it not suggest that you

1 would have a lower reserve requirement for nuclear and
2 a higher reserve requirement for coal? I am not saying
3 you do this, but if you did to that, what you did in
4 Delta, you would then have to reduce the nuclear
5 reserve requirement and increase the coal reserve
6 requirement?

7 A. No.

8 Q. No? Well, a higher DAFOR means a
9 higher reserve requirment, doesn't it?

10 A. Yes.

11 Q. So, your coal DAFOR is higher than
12 your nuclear DAFOR?

13 A. Not for new units.

14 Q. All right. But we are talking about
15 existing units now.

16 A. If we are doing an incremental cost
17 calculation, then we are talking about new units. If
18 we are doing an incremental power calculation, we are
19 talking about new units.

20 Q. All right. Let me come back at this
21 another way.

22 You are proposing in Plan 15 to increase
23 the reliance within the Ontario system generation on
24 nuclear, isn't that correct, as a percentage and as an
25 absolute?

1 A. Not to my knowledge.

2 Q. Plan 15 doesn't include an increasing
3 percentage of nuclear generation as compared to --

4 A. I believe by the end of the plan
5 period the per cent of nuclear generation in a total
6 sense is about the same as it will be in 1993 when
7 Darlington is in-service.

8 Q. All right. Is it true that as you
9 increase the amount of load-following options, you
10 would tend to decrease the reserve margin; is that
11 right, that you would need?

12 A. Not to my knowledge.

13 Q. Mr. Taborek, really this is your
14 area; isn't it?

15 MR. TABOREK: A. I have nothing to add.

16 Q. So, you don't think that load
17 following would naturally decrease your reserve
18 margins, no?

19 A. Nothing to add.

20 Q. Fine.

21 THE CHAIRMAN: I'm sorry, I didn't get
22 the answer. What did you say?

23 MR. TABOREK: Nothing to add to Mr.
24 Snelson's comment.

25 THE CHAIRMAN: Fine.

1 MR. SHEPHERD: Q. And Mr. Snelson's
2 answer was, no, it would not reduce reserve margin; is
3 that correct?

4 MR. SNELSON: A. Not to my knowledge.
5 You would have to be far more specific about the
6 characteristics of the options that you are talking
7 about.

8 Q. Let's be more specific then. I am
9 going to hypothesize two load-following options and I
10 am going to hypothesize an option that dramatically
11 reduces space heating in all sectors. I don't care
12 what it is. It's an incentive program, let's say. And
13 I am going to hypothesize regulations that require more
14 efficient commercial lighting systems in commercial
15 buildings. Just take that combination, that's your
16 load-following option, those two things. Let's say
17 it's a lot.

18 A. Is this one option or two options?

19 Q. One option, together. The Energy
20 Efficiency Act, 1992.

21 If you have that situation, and it is a
22 significant number, assume it's a significant number,
23 would that tend to cause you to reduce your reserve
24 margin?

25 A. Not necessarily.

1 Q. And when you say "not necessarily,"
2 what do you mean?

3 A. There are a number of factors that
4 work in opposite directions.

5 To the extent that part of your option
6 package was a reduction in loads that would occur at
7 the time of peak load, then that would reduce the
8 amount of capacity that you use to establish your
9 reserve margin -- the amount of load, sorry, that you
10 use to establish your reserve margin. The reserve
11 margin is calculated as a percentage of the peak load.

12 Q. Yes?

13 A. So, having reduced the peak load, you
14 would definitely reduce the amount of capacity you
15 need.

16 Q. Calculated absolutely as opposed to
17 as a percentage?

18 A. Calculated in megawatts terms.

19 Q. I am asking about the percentage.

20 A. As to the per cent reserve of the new
21 peak load, then you have to take into account such
22 factors as what has happened to the variability of peak
23 load, you also have to take into account to do this
24 calculation that by reducing the peak load more than
25 the load at other times, load curve has now become

1 flatter. And so, if you are at risk from a reliability
2 point of view when you are close to peak load, you are
3 now going to be close to peak load for a higher
4 proportion of time. So, the risk due to the load being
5 high for a large proportion of time is not accounted
6 for in your example. And it would be a very difficult
7 exercise to definitively determine whether the reserve
8 margin went up or down as a result --

9 Q. And there is no generalization you
10 can make about that then?

11 A. No.

12 Q. Let me ask a question about the high
13 load factor thing you were just talking about. This is
14 something that has confused me since you mentioned it
15 in direct, or Mr. Taborek did.

16 I understand your evidence to be that a
17 utility will generally like to increase it's load
18 factor.

19 MR. TABOREK: A. Yes.

20 Q. But I also understood your evidence
21 to be that as you increase your load factor, I am not
22 sure whether you have to increase your reserve margin
23 or you have more a reliability problem because your
24 peaks are longer; is that...

25 A. As Mr. Snelson just described, when

1 you get into trouble you tend to get into trouble for
2 longer periods, simply stated.

3 Q. Okay. Which would tend to mean that
4 you don't like a high load factor; is that right?
5 Maybe it's not important.

6 A. Yes.

7 Q. Yes, you don't like a high load
8 factor or yes, it's not important?

9 A. Yes, you don't like a high load
10 factor for that reason. And I think there are pros and
11 cons to having higher load factors.

12 Q. Okay. Is it fair to say that if you
13 increase the nuclear component of a system, you will
14 generally require a higher reserve margin, all other
15 things being equal?

16 MR. SNELSON: A. It depends what system
17 it is that you are increasing it from.

18 Q. So, there is no generalization you
19 could make there, that it will tend to do that, say, or
20 or more often than not?

21 A. If the numbers that you have given us
22 here, if you have an option that you are adding to a
23 system that incrementally has a load-meeting
24 capability, such that it is less than the average
25 load-meeting capability of the system, then that would

1 tend to move your reserve margin up.

2 If you had an option that incrementally
3 has a load-meeting capability larger than the
4 load-meeting capability of the system, that would tend
5 to move your reserve margin down.

6 The system is like an average, if you
7 like, and if you are averaging into the base something
8 which is higher than average, it's moving the average
9 up, if you are averaging something to the base that is
10 lower than the average, it is moving the average down.

11 Q. I guess I understood, and maybe I am
12 just wrong here, but I guess I understood that the
13 extent to which an option was move flexible would
14 change its impact on reserve margin; that is, nuclear,
15 for example, you essentially run flat out. So, the
16 more that you have, the less flexibility you have in
17 your system; isn't that right?

18 A. Flexibility and reliability are
19 slightly different concepts.

20 Q. Well, if you have more flexibility
21 don't you have more reliability, generally speaking?

22 A. The tendency would be in that
23 direction, but I am not sure that it is necessarily a
24 significant factor.

25 Q. Is it also fair to say that increased

1 non-utility generation will generally result in a
2 decreased reserve margin, all other things being equal?

3 A. To some degree, yes, presuming it has
4 higher load-meeting capability than the system average.

5 Q. I only have one other issue to deal
6 with on the subject of reliability. You talked about
7 this a little bit, and that is common mode failure.
8 And just so we don't get into the same problems as we
9 had with DAFOR, could you take a crack at defining
10 common mode failure?

11 MR. TABOREK: A. It is a failure that
12 effects more than one unit at a time, and by contrast,
13 other failures that don't have common modes, each unit
14 fails in a totally independent manner.

15 Q. It's also referred to as common cause
16 failure for that reason?

17 A. Yes.

18

19

20

21

22

23

24

25

...

1 [12:12 p.m.] Q. Would you say it is restricted to
2 technical problems as with DAFOR equipment-type
3 problems, or is it a broader concept than that?

4 A. Well, It would depend on what you
5 were using the concept for, because it is just a
6 concept at the moment. If you were going to take that
7 concept and apply it to reliability calculations, it
8 would be the DAFOR description that we had used
9 earlier.

10 Q. So, are the problems you found in the
11 pressure tubes at Pickering, are they an example of
12 common mode failure?

13 MR. SNELSON: A. The failures at
14 Pickering, the first one that ruptured, and I forget
15 whether that is Pickering 2 or Pickering 1, and then
16 the subsequent need to take out the second unit because
17 of the same problem, is a common cause failure, yes.

18 Q. If it turns out that all of the
19 rotors at Darlington have the same cracking problem
20 that the the first one did, I don't know whether you
21 have already solved that or not, I don't know, but if
22 it did, would that be a common cause failure as well?

23 A. That would be classified as a common
24 cause failure, yes.

25 Q. Let me take another example.

1 Suppose that tomorrow morning a
2 government study came down saying the low level
3 radiation for nuclear facilities is a far greater
4 health hazard than anybody ever expected, just
5 hypothetically, and as a result the AECB said, "Hydro,
6 you have got to shut them down for a while, until we
7 figure this out." That would be a common mode failure?

8 A. I think it is a very, very remote
9 possibility.

10 Q. Yes, of course.

11 A. It may be classified as a common
12 cause failure. It is certainly within the concept. I
13 don't know quite how it would be recorded, but...

14 Q. But in the context of reliability
15 analysis, it would not be, right?

16 A. I think it is the sort of
17 circumstance that a reliability analysis is not
18 addressing.

19 MR. TABOREK: A. In the mathematical
20 analysis, it is addressed in another fashion.

21 Q. Which is?

22 A. The chance of a common cause failure
23 is dealt with in two ways in setting our reserve
24 margin.

25 No. 1, it is one of the factors that we

1 know we do not model, and so that the true analytical
2 minimum total customer cost, if you will, is higher
3 than the minimum total customer cost that we compute
4 using the model. Therefore, it is one of the factors
5 which suggests we should be to the right of the
6 computed analytical minimum total customer cost point.

7 And the second factor is that our
8 calculations use an emergency interconnection
9 assistance of about 700 megawatts, limited by the
10 amount of interconnection assistance we believe would
11 be available when neighboring utilities and ourselves
12 have made coincident load forecast errors, which it is
13 likely we would do.

14 And so, in the instance one of the
15 hypotheses you mentioned, tomorrow a large block of
16 generation was gone for a common cause, that would be a
17 common cause, but we would not be in the coincident
18 load forecast error problem, and so that our emergency
19 interconnection assistance would be larger. So, we
20 generally note that that tends to balance a range of
21 common cause failures.

22 Q. Of course that is going to depend on
23 when the common cause failure occurs, and on how long
24 it is, isn't that right, whether you have the
25 interconnection assistance?

1 A. That is correct. What you would then
2 postulate are two major failures at the same time,
3 which of course would tend to have a much lower
4 probability than either occurring.

5 Q. When you use DAFOR, you don't assume
6 that sometimes forced outages will happen when you have
7 lots more interconnection, and sometimes they will
8 happen when you have less interconnection. You make an
9 assumption that you will only have so much when it
10 happens, right?

11 A. No, I think I have just described to
12 you that we do make assumptions that we'll have
13 different amounts available at different times and
14 different circumstances.

15 Q. In the F&D model?

16 A. When we run the F&D model, and we are
17 looking at case of the coincident load forecast error
18 problem, then we use the single number of 700
19 megawatts.

20 Q. The reason for that is, if I
21 understand it correctly, that it is not as big a
22 problem to worry about what is going to happen if you
23 have a forced outage in September. The real thing you
24 have to be concerned about in reliability is what about
25 December 15 or January 15.

1 A. No, you have to really worry about
2 every hour of the year.

3 Q. The reason you use 700 is because
4 that is the sort of thing you will have when it is a
5 worst case scenario?

6 MR. SNELSON: A. We don't expect to be
7 limited to 700 megawatts each and every winter peak
8 period.

9 Q. But you feel that is a safe number to
10 use in determining how much you can rely on from
11 another utility?

12 A. We don't appropriate.

13 MR. TABOREK: A. We don't appropriate,
14 let's say.

15 Q. Okay, appropriate, sorry. Nothing is
16 safe in this, right? It is a cliff.

17 And the effect of that, if I understand
18 it correctly, is that since you are calculating your
19 reserve margin for winter peak, right? That is where
20 it is driven to?

21 MR. SNELSON: A. The reserve margin is
22 quoted relative to the winter peak.

23 MR. TABOREK: A. But it is calculated.
24 It is an annual calculation for the entire year.

25 Q. I guess I'm just getting a sense that

1 your answer on common cause failure is that you treat
2 it differently than you would treat DAFOR. DAFOR is
3 uncertain. It could happen at any time, so you have to
4 assume it will happen at the worst possible time.
5 Common cause failure is also uncertain, but you don't
6 assume it will happen at the worst possible time, isn't
7 that right?

8 MR. SNELSON: A. We assume that DAFORs
9 can occur at any time.

10 Q. Therefore for planning purposes could
11 occur at the worst possible time?

12 A. They are given the probability of
13 occurring at the time of peak load.

14 Q. But you don't do that with common
15 cause failures?

16 A. We have said that we have not
17 included them in the reliability calculation, because
18 we are not able to define them in probabilistic terms.
19 So, they are handled judgmentally in the two ways that
20 Mr. Taborek has explained.

21 Q. One of those ways assumes that common
22 cause failure doesn't have the same probability as
23 DAFOR of happening at the worst possible time, right?

24 A. We expect that common cause failures
25 are lower probability events than regular amounts of

1 DAFORs.

2 MR. TABOREK: A. I think part of the
3 difficulty here may be that you are confusing two time
4 periods. The one is when you are talking about DAFORs,
5 you are talking about the peak in the year. When we
6 are talking about common cause failure occurring at a
7 time of load forecast error coincidence, it is
8 something that occurs over a period of many, many
9 years.

10 So, utilities over a period of time,
11 well, over four years is what we are looking at, could
12 make errors that are going in the same direction. So,
13 there are different time periods that can help us sort
14 those out.

15 Q. Does common cause failure include
16 regulatory restrictions that apply to a number of
17 units? I'm not going to go back to acid gas again.
18 But let's say the AECB came in and said, "We have got a
19 problem with all of your A units, your nuclear A units.
20 Fix it. Now."

21 That would be a common cause failure, or
22 would it be something else?

23 MR. SNELSON: A. I think it is not very
24 important in how it is classified. I mean, the effect
25 is that if units are shut down and they are not

1 available, then it doesn't matter what name you give
2 them.

3 Q. Well, I'm going to come in a minute
4 to Table 22A on page 30 of the 1990 reliability
5 indices, and you have some estimates of common cause
6 forced outages.

7 All I'm trying to do, just like with
8 DAFOR, is figure out what the term means before we go
9 to the numbers. So, we know it means a common cause
10 DAFOR, right? We figured out DAFOR is only equipment,
11 and we know that common cause failure at least includes
12 common cause DAFOR, is that right?

13 THE CHAIRMAN: Didn't Mr. Snelson earlier
14 say that it would if it into the common cause category,
15 that kind of circumstance, but that it never happened,
16 and he considered it remote, sort of, that it ever
17 would happen.

18 MR. SHEPHARD: I understand that. But
19 they have made some projections for how often it will
20 happen, and all I want to know is what "it" is.

21 MR. SNELSON: What is in the projection
22 is the things that we think have a significant
23 probability of occurring. The difficulty here is in
24 classifying things that have such a small probability
25 of occurring, that we haven't decided how we would

1 classify them.

2 MR. SHEPHARD: Q. So, from the point of
3 view of looking at these numbers then, any
4 non-equipment failures are not included in there.

5 MR. TABOREK: A. These are equipment
6 failures, and I should mention, we have qualified them
7 earlier, that we don't believe they include all
8 effects, and we don't use these in our calculations.

9 Q. You, in fact, said the other day that
10 you are -- your words were "not very satisfied"--

11 A. That is correct.

12 Q. --with these numbers. Maybe you
13 could expand on that. Why are you not very satisfied?

14 A. I believe I explained that in my
15 testimony the other day as well. That when you look at
16 our past history, we have experienced forced outage
17 rates higher than forecast, roughly 50 per cent at a
18 time, and a good number of those might be called common
19 cause failure.

20 Whereas, when you look at these numbers,
21 which are a subset of what might be common cause
22 failures, we get very low numbers. And, therefore, we
23 don't think we have good statistics. Therefore, we
24 have used another approach to judge the impact of this
25 on reserve margin.

1 Q. I take it then that if these numbers
2 are wrong, your expectation is that they are too low?

3 A. Yes.

4 Q. This, as you have said, is only
5 equipment failures. It doesn't include things like
6 disruptions of fuel sources or strikes or anything like
7 that.

8 A. That is correct.

9 Q. Maybe you could just describe how
10 this table works for a second. I realize that you
11 think the numbers are too low, and you are not
12 comfortable with them, but let's just see what we've
13 got here so far, okay?

14 This is nuclear. I'm just picking on
15 nuclear because...

16 THE CHAIRMAN: What table are we looking
17 at?

18 MR. SHEPHARD: This is page 30 of the
19 1990 forecast of reliability indices, which is Exhibit
20 148. It is Table 22A.

21 Q. So, where it says here, for example,
22 the possibility of a two-unit outage at Pickering of
23 170 days plus or minus 50 in a thousand years -- sorry,
24 170 times plus or minus 50 over a thousand years, and
25 you have a duration in days of four days plus or minus

1 two, can I just multiple that out and say, your
2 probability is that 680 days out of a thousand years
3 you will have a two-unit common cause failure at
4 Pickering?

...

1 [12:26 p.m.] MR. TABOREK: A. Yes.

2 Q. So, that would work out then - and I
3 will just ask you to accept this on faith for now and
4 we can check the numbers later - that would work out to
5 0.86 per cent probability?

6 A. I think it would be roughly two in a
7 thousand, in round numbers.

8 Q. Right, okay, 0.86 is actually more
9 specific, but, yes, two in a thousand.

10 And then if you went to the upper bound,
11 which is 220 incidents, right, 170 plus 50? At a
12 duration of 6 days, at the absolute upper bound of your
13 range, that would be 1320 days in a thousand years,
14 which would be, let's say, four chances out of a
15 thousand on any given day that you would be out
16 four-tenths of 1 per cent, roughly.

17 If you look at the lower bound, it is
18 actually less than one-tenth of 1 per cent probability
19 that you would have a two-unit. Now, are these
20 cumulative? You have two-unit, four-unit, and
21 eight-unit outages, so are they cumulative in the sense
22 that you could add them all together to get a
23 probability of any common cause outage at Pickering?

24 A. I don't know the answer to that.

25 Q. I wonder if you could just provide

1 us, undertake to provide us with the relevant
2 percentages of probability, like DAFOR, sort of a
3 common cause outage factor - we will have to create a
4 new acronym for it - for these various projections on
5 ths chart? Could you do that?

6 A. Yes.

7 Q. That would be 54, is that right,
8 142.54?

9 MRS. FORMUSA: 55.

10 THE CHAIRMAN: 55.

11 MR. SHEPHERD: 142.55.

12 Q. Now you said in that report - I won't
13 go to it - but you said in that report, the common mode
14 outage forecast is based on actual station experience
15 plus the judgment of Ontario Hydro experts.

16 MR. TABOREK: A. Yes.

17 Q. Was a study done of some sort or a
18 specific data analysis?

19 A. No.

20 Q. I mean it wasn't just somebody
21 sitting down and saying, "Well, let's use 170"? It was
22 more sophisticated than that?

23 A. I think some rudimentary calculations
24 would have been done, but I would not call it an
25 analysis.

1 Q. Okay. Now, when you are looking at
2 the past history, of course, you are including things
3 like pressure tubes; right?

4 A. Yes.

5 Q. And this is the reason why you are
6 not satisfied with the numbers: that if you look at
7 things like pressure tubes, they tend to be longer and
8 more of a problem than this suggests? Did I understand
9 that right?

10 A. I have described my rationale for
11 dissatisfaction, yes, and that's one of them.

12 Q. Is it fair to say that where a system
13 relies heavily on a particular technology, a particular
14 design or a particular technology, that the likelihood
15 of common mode failure increases?

16 A. I think the answer is, to a degree,
17 yes and, to a degree, no. There are utilities that are
18 one hundred per cent hydraulic, there are utilities
19 that are one hundred per cent coal. It depends on the
20 particulars of the hydraulic units and the particulars
21 of the coal units. And so I cannot give you an
22 across-the-board answer to it. But in some instances,
23 if there are common elements right across the system,
24 then yes.

25 Q. Is it also fair to say that the

1 younger the technology is that you are using, all other
2 things being equal, there is probably a higher
3 probability of common mode failure?

4 A. No. If we use a lot of combustion
5 turbines, for instance, that would not necessarily lead
6 us into a large amount of common mode failure. You
7 would have to look at the characteristics of that
8 technology.

9 Q. So, you don't think that a mature,
10 more well-known technology is less likely to have
11 common mode failure?

12 A. The most mature technology is, I
13 believe, the hydraulic system -- no, I guess. No, I
14 don't. The new technology is going to have more
15 teething problems. It doesn't necessarily mean there
16 are going to be common mode failures because there are
17 three types of problems that can occur: teething
18 problems, the mature, and the wear. And in the mature
19 and the wear, they occur after a period of time and
20 common modes can be in any one, so no.

21 Q. Will common mode failures generally
22 be more likely related to design than to operations,
23 all other things being equal?

24 A. I think you described a -- I can't
25 answer that.

1 Q. You don't know whether --

2 A. There is just not enough information.
3 It is just too hypothetical a statement to respond to.
4 There is just no information there other than design
5 and operation.

6 Q. All right. Is it true that as your
7 generation system relies more heavily on a particular
8 technology, the impact of a common mode failure
9 affecting that technology increases, it's worse?

10 A. Well, again, I think I answered this
11 just a few questions previously. If we had a one
12 hundred per cent coal system, it is unlikely that each
13 and every generator, for instance, on that system would
14 be absolutely identical, and therefore maybe all the
15 generators of manufacturer "X" might experience a
16 common mode failure, but that doesn't mean that all the
17 generators on the system are manufacturer "X"s, even
18 though it is all the same technology for instance.

19 Q. I will just give you a sort of
20 hypothetical and we will see whether we can get there
21 from there.

22 Let's suppose your entire system is
23 identical to Pickering "A" units with whatever they
24 were, zirconian, whatever they were, pressure tubes.

25 A. Clones.

1 Q. Pardon?

2 A. We have clones. We have a system
3 made up entirely of clones.

4 Q. Exactly.

5 A. Is that what you are referring to?

6 Q. All right.

7 A. Yes. And that --

8 Q. The pressure tube in Pickering 1
9 breaks.

10 A. In that hypothetical but unrealistic
11 case because no utility would do that.

12 Q. Okay. But if you had all Pickering
13 "A"s throughout the system --

14 A. Yes, certainly.

15 Q. That would be a lot more serious than
16 it was when it happened; right?

17 A. Yes, certainly.

18 Q. Isn't it true that the more Pickering
19 "A"s you have relative to the size of the system, the
20 more serious a common mode failure in that type of unit
21 would be.

22 A. In that hypothetical example, yes.

23 Q. I am not asking about the
24 hypothetical now. I am saying you have got the
25 hypothetical over here, you have what happened there --

1 A. Then I go back to my answer with
2 respect to real systems.

3 Q. All right.

4 Let me ask, Mr. Snelson, you talked about
5 the other day, I don't know remember, I think it was
6 Wednesday or Thursday, you talked about the fact that
7 coal piles can freeze under certain winter conditions
8 and the result might be you would have deratings of
9 several units; right?

10 MR. SNELSON: A. Yes.

11 Q. Just as an aside. If that happened
12 would that be included in DAFOR?

13 A. Yes, I believe so.

14 MR. BARRIE: A. Yes.

15 Q. But it would not be for the
16 reliability indices, is that right? When you are doing
17 your calculations, it would not be?

18 MR. SNELSON: A. I believe that would be
19 in the reliability indices.

20 MR. TABOREK: A. And I think we properly
21 should take it out. So, we are perhaps over stating
22 DAFOR. I think we would fix --

23 MR. SNELSON: A. You can consider it to
24 be a failure of the coal handling equipment.

25 Q. All right.

1 MR. BARRIE: A. Let's put the thing in
2 perspective here. We operate our coal piles such that
3 we do not suffer a great deal of deratings because of
4 this phenomenon.

5 Q. Now, what causes them to freeze.
6 Maybe you can just briefly describe that.

7 A. Cold weather. (laughter)

8 Q. No, I realize it's cold weather, but
9 is it a particular combination of precipitation and
10 cold or is it a combination of the size of it and the
11 cold, or is it just if it's too cold it freezes.

12 A. Well, to be honest, the major problem
13 we have with coal piles is not so much particularly
14 cold weather causing freezing because one tends to just
15 scrape the top of and the coal underneath is normally
16 okay, so that's why I wanted to say right away that
17 this is not a major problem.

18 However, we do have problems with
19 handling coal piles. Often if it is extremely wet,
20 that can actually be a bigger problem than actually
21 freezing coal piles.

22 Q. Would it be fair to say that if you
23 had one of those weather-related coal pile problems at
24 Lambton, there is a good possibility that you would
25 have a similar problem at Nanticoke?

1 A. Given that Nanticoke and Lambton
2 aren't too far apart, they could well both experience
3 wet conditions at the same time.

4 Q. But now I am getting back to
5 definitions again. That would not be a common mode
6 failure, would it, common cause failure?

7 A. Operationally we don't go to great
8 lengths to define common mode failure.

9 Q. That is not the type of thing that
10 you, Mr. Taborek, have included in your analysis?

11 MR. TABOREK: A. No.

12 Q. I was going to ask about zebra
13 mussels and common cause failure, but I just can't
14 bring myself to do it. (laughter)

15 Let's go to service lives. Could you
16 turn to interrogatory -- now this one is out of order,
17 I think. It is in Interrogatory 2.9.7, which I thought
18 was in this pile.

19 THE CHAIRMAN: Can we have the number
20 again, please.

21 MR. SHEPHERD: It is 2.9.7, Mr. Chairman.
22 It should be in here. It is not in my pile. Does
23 anybody have it in their pile.

24 ---Off the record discussion.

25 MRS. FORMUSA: I have it. I put it

1 together, so...

2 MR. SHEPHERD: I see. So, the witnesses
3 have it, but nobody else does.

4 Let's see if we can get by without it,
5 okay, let's see if we can get by without it.

6 Q. You made the point there, and you
7 have actually made the point in the transcript as well
8 I believe, that the planning life, the service life you
9 use for planning and the real life aren't the same
10 thing; right? That is, just because you use a 40-year
11 planning life doesn't mean that in fact on the fortieth
12 birthday, you are just going to shut the thing off.

13 MR. TABOREK: A. It is the most likely
14 life. You're right it is not necessarily the same.

15 At the present time, although you're
16 planning a 40-year life for fossil units, you don't
17 currently have scheduled the closure of any fossil
18 units, do you, scheduled in the sense that you have
19 decided when such and such day comes, we are going to
20 close it?

21

22

23

24

25

...

1 [12:40 p.m.] A. That is correct.

2 Q. I have never actually heard of an
3 Ontario Hydro fossil unit being closed. I guess, what,
4 they just haven't gotten old enough to close them yet?

5 A. Actually, one of the earliest units
6 we have on our system in the early days of Hydro was a
7 fossil unit, and it was closed.

8 Q. That's Keith?

9 A. No.

10 MR. SNELSON: A. Scarborough Generating
11 Station.

12 MR. TABOREK: A. Scarborough Generating
13 Station.

14 Q. Scarborough Generating Station. My
15 records didn't go back that far.

16 Anyway, that's closed and you don't use
17 it anymore.

18 A. That's correct.

19 Q. There's a park or something there,
20 right?

21 A. I am told it's under Hearn somewhere.

22 Q. All right.

23 A. I don't know its age when it closed.

24 Q. You have two though, Hearn and Keith,
25 that are mothballed, right?

1 A. Yes.

2 Q. And you currently have plans to --
3 let me come back to the plans in a second.

4 You had some discussions the other day
5 with Mr. Watson, I think, about a possibility that you
6 could actually run units like Hearn and Keith, for
7 example, or any of the other ones, far beyond their
8 40-year life if you repowered them or rehabilitated
9 them in some way. There is a lot of opportunity to
10 extend, isn't there, if you are willing to spend the
11 money.

12 A. No, I don't think I said that.

13 Q. Okay. I got the impression that you
14 had a fair bit of flexibility based on your economic
15 decision at year 35 or 40, or whenever.

16 A. What I said was that you might then
17 be able to, and then you might extend. But I didn't --
18 what was the word you used? The implication that there
19 were plenteous opportunities?

20 Q. I said a fairer degree of
21 flexibility.

22 All I am really getting at, it's an
23 economic decision at that point, right?

24 A. No. There are four factors which I
25 outlined in my direct. The equipment condition, the

1 economic considerations compared to new technology, the
2 environmental considerations, and the availability of
3 new options.

4 Q. Okay. Nuclear is different in that
5 respect, though isn't it? That is, when you get to the
6 end of the life of a nuclear station, you don't have
7 the same four options, the same four factors, do you?

8 A. I think you do.

9 Q. Isn't it true that at a certain point
10 in time everything in the nuclear station becomes too
11 radioactive to use it anymore for power production,
12 even the containment unit, in fact? Isn't that just a
13 fact of physics?

14 A. Not that I am aware of. And it's
15 certainly not going to happen before the 40 years. I
16 must say, I am not an expert. You may wish to pursue
17 this with the nuclear panel, which is 9.

18 MR. SNELSON: A. It's Panel 9. And the
19 operation of the tritium removal facility to detritiate
20 heavy water is one way of reducing the radioactive
21 levels, levels of radioactivity in an operating station
22 over a period of time.

23 Q. Could you take a look at
24 Interrogatory 2.7.50. Unfortunately, again in this
25 interrogatory, the pages are not numbered. I am going

1 to ask you to go to the sixth last page of the
2 interrogatory. That page says at the top --

3 MR. TABOREK: A. We only received the
4 four cover sheets. Is that what you are referring to?

5 Sorry, sixth last.

6 Q. There is a copy there.

7 MR. BARRIE: A. I think we have got it.
8 What was the page?

9 Q. The sixth last page it says, on the
10 upper right-hand corner it says "1980 DRC Extract."

11 MR. TABOREK: A. Yes.

12 Q. Okay. And that says, nuclear
13 generating stations are designed to operate for 30
14 years; right?

15 A. Yes.

16 Q. And it says, let's use a 30-year
17 assumption of service life; right?

18 A. Yes.

19 Q. And could you then turn six more
20 pages towards the front, and this page is headed up
21 "1981 DRC Extract."

22 A. Yes.

23 Q. This is the point at which Hydro
24 decided to change the service life assumption from 30
25 years to 40 years; is that correct?

1 A. Yes.

2 Q. And it was based on an analysis that
3 took place during that year; is that right?

4 A. Well, I was not on the DRC at the
5 time, but yes, analyses would have been going on over a
6 period of time, and I would believe the DRC at that
7 point would have felt sufficient evidence was available
8 to effect a change.

9 Q. Well, you are on the DRC now?

10 A. Yes.

11 Q. And every year you have to decide
12 what service life to use for nuclear; isn't that right?

13 A. Yes.

14 Q. So, presumably, you have to go back
15 every year and review the basis on which you using 40
16 years now?

17 A. Yes.

18 Q. And I am asking you then, what is the
19 basis on which you are using 40 years now?

20 A. The basis is that the DRC moved to
21 that in 1981 for 1982.

22 Q. Well, I don't think that's the basis,
23 maybe it's just my semantics.

24 A. And that we have revisited the
25 decision every year since then and we see no reason to

1 change.

2 Q. So, each year when you look at the 40
3 years, you don't say, there was this study or this
4 piece of work done that justifies 40 years and it is
5 still valid?

6 A. What you have is an accumulation of
7 knowledge over time that permits you to check whether
8 in the light of what you know now, which will certainly
9 be different than what you knew in 1981, the 40-year
10 life is valid. So, for instance, one of the things
11 that in '80 the reference was to nuclear stations being
12 designed for a 30-year life, "B" stations are designed
13 for a 40-year life. The fact that components have
14 40-year lives, for instance, is relevant.

15 Q. So, each year when the Depreciation
16 Review Committee sits down and does this, you don't go
17 back to square one; you just say, "Did anything happen
18 in the last year to make us change this"?

19 A. What you do is you review all that
20 you consider to be relevant to the decision you are
21 making.

22 Q. Well, I am trying to get a category
23 of what sorts of things you consider relevant to the
24 decision you make and I don't think you have told me
25 yet.

1 Is my example right?

2 A. All of the things are relevant.

3 No, we do not go back and dig out the
4 1981 files and read them. We do, however, have people
5 contributing to that judgment who are aware of what was
6 done in the various years.

7 Q. Now, if you just take a look at the
8 bottom of that page, the recommended remaining life you
9 have for obviously for Pickering and Bruce and you also
10 have for NPD, Nuclear Power Demonstrator, which is the
11 small unit at Rolphton, right, and also Douglas Point?

12 A. Yes.

13 Q. And these would have the NPD going
14 out of service, that's the Nuclear Power Demonstrator,
15 going out of service in 1998, if I do my calculations
16 correctly, and Douglas Point going out of service in
17 2008; right? Just do the numbers from '81, add those
18 27 years, you get 2008.

19 A. Yes.

20 Q. Isn't it true that if you go through
21 this, and I will ask you to check to make sure this is
22 true, that up to and including the '84 Depreciation
23 Review Committee Report, those numbers remained; that
24 is, those numbers of years remained for NPD and Douglas
25 Point?

1 A. Subject to checking, yes.

2 Q. But they are not still in operation
3 now?

4 A. That's correct.

5 Q. When were they closed? If I said
6 Douglas Point was '84 and NPD was '87 --

7 A. In the mid-80s, I would have
8 answered.

9 What were the years?

10 Q. Douglas Point was '84 and Rolphton
11 was '87, that's NPD was '87?

12 A. That sounds about right.

13 Q. So, in 1984, then, the Depreciation
14 Review Committee would be saying, assume another 24
15 years, I guess, for Douglas Point, and then within the
16 year it was closed.

17 A. Yes.

18 Q. Do you have any idea why that is?
19 Were they just wrong or had somebody already made a
20 decision that they didn't know about?

21 They didn't even last their original
22 design life, did they?

23 MR. SNELSON: A. Both of these
24 facilities were owned and operated by Atomic Energy of
25 Canada Limited. Now, both were somewhat in the nature

1 of prototype facilities. The NPD was a very small
2 prototype, the sort of smallest prototype that could
3 produce a useful amount of power.

4 Q. It was 250 megawatts?

5 A. No. NPD was about 20 megawatts --

6 Q. Sorry, 20.

7 A. Forty megawatts. Quite small.

8 Douglas Point was 200 megawatts.

9 Q. Okay.

10 A. My understanding of the circumstances
11 surrounding the Douglas Point retirement was that
12 Atomic Energy of Canada essentially made that decision,
13 in that, they decided that they no longer wanted to
14 continue operating the station.

15 Q. So, it had nothing to do whether you
16 could have operated it longer; AECL decided that they
17 didn't want to have it operated any longer?

18 A. They were getting certain revenues
19 for the electricity that was produced from the plant
20 and they were probably facing some repair costs and
21 they decided that they didn't wish to continue
22 operation.

23 Q. Is it true that Hydro is alone among
24 all the nuclear utilities in the world in assuming a
25 40-year life for nuclear?

1 MR. TABOREK: A. I don't know the answer
2 to that. I am not aware of other utilities who also
3 assume 40 years.

4 Q. Well, you are on the Depreciation
5 Review Committee, presumably one of the things you look
6 at is what other utilities do.

7 A. Yes.

8 Q. You have never seen another utility
9 uses 40 years?

10 A. No.

11 Q. Have you seen lots of utilities that
12 use 25, 30 and 35 years?

13 A. Yes.

14 Q. Now, you actually have no experience
15 with aging nuclear stations, do you, that is Ontario
16 Hydro?

17 A. We have a lot of experience with
18 aging nuclear stations, with 20 units.

19 Q. Well, okay. You said at page 2865 of
20 the transcript, which is in Volume 16, I will read it
21 to you:

22 "There is little or no experience with
23 the operation of modern, high pressure
24 fossil plants and nuclear plants for long
25 periods of time. We basically don't know

1 that they can be economically maintained
2 for more than 40 years."

3 A. Yes.

4 Q. Now, your oldest nuclear facility is
5 20 years old; right?

6 A. Twenty-one, yes.

7 Q. So, is it fair to say that, in fact,
8 not only do you not know whether they can be run
9 economically over 40 years, but you don't know whether
10 they can be run economically over 30 years or over 25
11 years; is that right?

12 A. You are putting "know" in the sense
13 of an absolute guarantee. We believe, and the
14 information we have suggests, that that is a reasonable
15 life for those units and that that is the life that we
16 would get from them.

17 Q. But that's not based on experience,
18 either yours or anybody elses?

19 A. No, clearly not. When you only have
20 21 years of use in your oldest, you clearly don't have
21 the 22 to 39 years of experience.

22 Q. And nobody else in the world has any
23 that are older; do they?

24 A. Not with CANDU.

25 Q. Well, even with other ones. Isn't

1 the oldest nuclear facility in the world now 23 or 24
2 years old; isn't that right? About right. Certainly
3 not 40 years.

4 A. I think that's probably correct. I
5 don't know the answer to that. I think you could
6 address that to Panel 9.

7 Q. So, you have a forecast that is not
8 based on direct experience?

9 A. That's correct. Most forecasts have
10 to be that way.

11 Q. Well, if you are forecasting the life
12 of a hydraulic facility, you have, what, 150 years
13 around the world of experience with hydraulic
14 facilities? It's pretty different.

15 A. Well, not with our types of hydraulic
16 facilities. The load forecast, we have no experience
17 with the loads in the year 2000.

18
19
20
21
22
23
24 ...
25

1 [12:56 p.m.] Q. Fair enough.

2 A. That is why it has to be a forecast.

3 Q. So, you have a forecast that is not
4 based on experience and is out of step with everybody
5 else's in the world, right?

6 A. Not necessarily. One of the reasons
7 that utilities in the U.S. use -- set their lives is
8 that they are quite often associated with the licences
9 that are given for the unit, rather than an appraisal
10 of what the life actually is. And in the U.S., there
11 is considerable emphasis now on extending the lives of
12 nuclear plants over their present licence lives.

13 Q. So, if we were to compare the various
14 service life assumptions of utilities and regulators
15 and others in the United States, as against, let's say,
16 Britain, before the privatization there, or France, or
17 any of the European countries that have nuclear, we
18 would find that in the United States, they use lower
19 lives, generally. Is that the import of what you are
20 saying?

21 A. If you wish to go into a detailed
22 country-by-country comparison of lives, I would refer
23 you to Panel 9.

24 Q. Well, is it the nuclear people who
25 set the life for...

1 A. We set the life.

2 Q. You sit on the committee.

3 A. Yes.

4 Q. But you don't want to talk about it.

5 MR. SNELSON: A. There are nuclear
6 people who sit on...

7 MR. TABOREK: A. There are nuclear
8 people who are also on the committee.

9 MR. SNELSON: A. Who bring the specific
10 knowledge and nuclear technology to the committee.

11 MR. TABOREK: A. We bring the system
12 needs to the committee.

13 MR. SHEPHARD: Mr. Chairman, this might
14 be an appropriate time to have lunch, if that is
15 convenient.

16 THE CHAIRMAN: You are satisfied with
17 those answers?

18 MR. SHEPHARD: I have been sort of
19 dissatisfied for the last hour, but I think I've got
20 what I can get.

21 THE CHAIRMAN: We will adjourn until
22 2:30.

23 ---Luncheon recess at 12:59 p.m.

24 ---On resuming at 2:33 p.m.

25 MR. SHEPHARD: Mr. Chairman, at the

1 current rate, it looks like this cross-examination by
2 IPPSO will be completed sometime mid-morning on Monday.

3 Q. For some reason, I skipped a question
4 earlier that I hadn't meant to skip, so I'm going to go
5 back to it, if you don't mind.

6 Can you just give us a brief description
7 of the current in-service problems with Darlington, the
8 current status of it?

9 THE CHAIRMAN: I am sorry, I didn't hear
10 that.

11 MR. SHEPHARD: Q. The current in-service
12 problems at Darlington. There have been some delays.
13 Could you just give us the current status?

14 MR. BARRIE: A. We just did that. We
15 did that two days ago. Do you want me to repeat it?

16 Q. I am sorry, I thought I read the
17 transcripts fairly carefully. I didn't see it; maybe I
18 missed it. Maybe you could just summarize it briefly,
19 so I could...

20 A. Both Darlington Unit 1 and Unit 2 are
21 not operating at the moment.

22 Q. Yes.

23 A. The problem with Unit 2 is a problem
24 with the fueling machine and associated damage to the
25 fuel bundles. The precise cause of it hasn't been

1 established yet, but that is the nature of the problem.

2 Unit 1 has been taken off for
3 examination, to see if similar problems exist, and at
4 this point in time, it appears that there is some
5 problem on Unit 1. There is no actual broken fuel
6 bundles as such, but there is some evidence that there
7 has been some stress, some scraping.

8 The net result of this is that it is
9 expected that Unit 1 will be on sometime during the
10 summer for some tests, but will have to come off again.
11 And both Unit 2 and Unit 1 will not be back in-service
12 properly until November of this year.

13 Q. So, the earlier cracked rotor
14 problems, you have now concluded that they are solved?

15 A. No, that is still under
16 investigation.

17 THE CHAIRMAN: So, that is an additional
18 problem to the ones you have already mentioned.

19 MR. BARRIE: Yes.

20 MR. SHEPHARD: Q. The cracked rotor
21 problem, if I understand that correctly - and maybe you
22 can just correct me if I'm wrong - this rotor is sort
23 of like the driveshaft; is that right?

24 MR. BARRIE: A. Let's make this
25 distinction right away. It has nothing to do with the

1 nuclear end of the generating station.

2 Q. No, I understand.

3 A. It is at the alternator.

4 Q. Yes.

5 A. It is that which is actually
6 producing electricity. So, it is the turbo alternator,
7 the shaft of the turbo alternator.

8 Q. And this shaft is, I understand,
9 something like three metres in diameter; is that right?
10 It is big.

11 A. I don't know.

12 Q. Does anybody have any idea? Are we
13 talking about something of very large size?

14 A. You'd be measuring it in metres,
15 single metres, if that is close enough for you. But I
16 don't know if it is three metres, two metres or four
17 metres.

18 Q. Am I right in understanding that you
19 used a new design for Darlington, in which you used a
20 hollow shaft rather than a solid shaft?

21 A. You are getting beyond my level of
22 expertise. I don't know.

23 Q. There is nobody on the panel that
24 knows anything about that?

25 MR. SNELSON: A. People on panel 9 would

1 be the nuclear experts, and they will have much more
2 detail.

3 Q. Now, related to that, then, the F&D
4 model, as I understand your evidence, Mr. Snelson, has
5 an uncertainty associated with in-service date of six
6 months before and twelve months after, is that correct?

7 A. That is correct.

8 Q. Of course, Darlington is well beyond
9 that, right?

10 A. Darlington, some of the Darlington
11 units are well beyond that, yes.

12 Q. The first two, two in one with the
13 problems are already substantially beyond that.

14 A. Yes. Our experience in four-unit
15 generating stations has been that we tend to be more
16 susceptible to delays and in-service dates on the first
17 and second units in the station than the third and
18 fourth units.

19 Q. In other words, if I'm right, you are
20 likely to have more teething problems with the first
21 ones you bring on?

22 A. Yes. When you are bringing four
23 essentially identical units into service, then you tend
24 to discover any problems on the first unit, and to a
25 lesser extent on the second. By the time you are ready

1 to commission the third and fourth units, then you
2 usually have got the problems fixed on the first and
3 second units, and you know what to do to fix the
4 problems, or to prevent them occurring on Units 3 and
5 4.

6 Q. Of course, Units 3 and 4 at
7 Darlington, their current planned in-service dates, if
8 I'm not mistaken, are still much later than you had
9 expected, say, two years ago, three years ago, is that
10 true?

11 A. I would have to check that. There
12 has been some slippage, I believe. I couldn't give you
13 the chapter and verse on the amount of slippage.

14 MR. TABOREK: A. Information on slippage
15 of nuclear unit in-service dates is contained in
16 Exhibit 87. There is a table in there that provides
17 that information.

18 Q. Oh, good. Now, when we are talking
19 about the uncertainty in in-service dates. You are
20 talking about the F&D model, right?

21 What about the LMSTM model? Does it have
22 any uncertainty in in-service dates in it?

23 A. I believe one of the, one of the
24 requirements of the LMSTM model is that all the units
25 be brought into service on January the 1st of a given

1 year. And that it doesn't have any facility to bring
2 units into service gradually. They come in on January
3 the 1st of the year.

4 Q. Do I take it your answer to my
5 question is no?

6 A. Our practice is to generally plan
7 units to be in-service somewhere towards the middle or
8 the end of the year, say August to October time period,
9 so that they will be in service before the winter peak,
10 which normally occurs December, January or February
11 following.

12 The structure of the LMSTM model requires
13 that the units be put into service on January the 1st
14 of a year. So, we will show them in the LMSTM model on
15 January 1st of the -- that usually follows their actual
16 planned in-service date. So, that will inherently have
17 some degree of lateness accounted for. But it is
18 part...

19 Q. Two or three months?

20 A. Two or three months. It is largely
21 driven by the structure of the model.

22 Q. Do you have any idea when the last
23 time was that you brought a unit, fossil or nuclear,
24 in-service within two or three months after its planned
25 in-service date?

1 A. I can't give you the precise dates,
2 but there are cases of units coming into service ahead
3 of their planned in-service dates.

4 Exhibit 87, the table lists the
5 in-service dates of units.

6 Q. So, it has a whole summary of it
7 there?

8 A. Yes.

9 Q. Excellent, thank you.

10 I understand you plan to demothball the
11 Hearn and Keith generating stations, is that correct?

12 MR. BARRIE: A. Current plans do not
13 include demothballing Hearn or Keith.

14 Q. Okay. I am sorry. I'm going to
15 leave that.

16 So, you have no plans right now, am I
17 clear, you have no plans right now to demothball Hearn
18 or Keith?

19 A. That is correct.

20 MR. SNELSON: A. From a planning
21 perspective, the situation remains as it is described
22 in the Demand/Supply Plan, that under median load
23 growth, we would not expect to have to use Hearn or
24 Keith.

25 Q. Correct me if I am wrong, I was

1 understand the impression that you had, at least, at
2 some time last year, a plan to have Hearn up and
3 running on December 1st, 1991, and in fact, there was
4 quite a controversy about that at the OEB. Am I wrong?

5 MR. BARRIE: A. No, that is correct.
6 There was a plan to demothball two units at Hearn.

7 Q. Yes.

8 A. That plan was changed, really, when
9 the load just fell away, and we reassessed the
10 situation and decided that it was no longer required.
11 And our analysis for this next winter and the next five
12 winters are that we would not require to restart Hearn
13 or Keith.

14 Q. Is it fair to assume that with
15 Darlington coming on stream over the next few years,
16 the short-term problem that you had, that you intended
17 to address, would be a problem later, and you'd have
18 Darlington, so you wouldn't need it? Is that right?

19 I know that wasn't a very eloquent
20 question. I am sorry.

21 Before Darlington, you could have a
22 possibility of a shortfall under the old load forecast,
23 but the new load forecast doesn't show the shortfall.

24 A. The reason we were bringing back
25 Hearn, because we were still expecting, in enough time,

1 significant load growth, and we were at that time also
2 experiencing delays with Darlington. The combination
3 of those two things were major factors in the initial
4 decision to bring back two units at Hearn.

5 Now that the load growth has been
6 radically reduced, at least in the short-term, in the
7 next two or three years, that need evaporated.

8 Q. So, at present, they are just sitting
9 there. You have no plans to do anything with them, is
10 that right?

11 A. No, they are not just sitting there.
12 No, two units in particular at Hearn are playing a very
13 useful role in power system operation. They are not
14 producing any megawatts, but we use them as what we
15 call synchronous condensers that help support the
16 voltage in downtown Toronto.

17 We have a problem maintaining adequate
18 voltage levels in Toronto, and we are using two units
19 at Hearn to help support the voltage levels. They are
20 not producing any megawatts, no power.

21 Q. Your voltage problem in Toronto is
22 because of the size of the load, relative to the local
23 generation, is that right, essentially?

24 A. The voltage problems in Toronto are
25 because we have heavy flows of power into the Toronto

1 area, and we have inadequate resources to maintain
2 voltage levels.

3 If you did have local generation, yes,
4 that does help to support voltage. There are other
5 ways of supporting the voltage, as well, though.

6 Q. For example, if you restarted Hearn
7 as a generating facility, that would also solve the
8 problem, wouldn't it?

9 A. That would help to maintain the
10 voltage levels, yes.

11 Q. Isn't it true that private sector
12 companies have approached Hydro and offered to acquire
13 Hearn and Keith and redevelop them using newer
14 technologies?

15 MR. SNELSON: A. I believe there have
16 been proposals with respect to both sides, yes.

17 Q. And isn't it true that in the case of
18 Hearn, the proposal was for a thousand megawatts of gas
19 cogeneration?

20 A. I'm not sure that it is appropriate
21 to discuss the specific non-utility generation
22 proposals. This really is a matter for Panel 5, and
23 those proposals would have come in through our
24 non-utility generation division, and they would be
25 familiar with the details of those proposals.

1 Q. If I were to ask you about the
2 proposals on Keith, you would give me the same answer
3 presumably?

4 A. Yes.

...

1 [2:46 p.m.] Q. At present, do I understand correctly
2 that Hydro does not have any intention to proceed with
3 any such proposals?

4 A. I suggest you direct that to Panel 5.

5 Q. You don't know the answer to that?

6 A. I know part of the answer but I don't
7 know the whole of the answer and I think you will get a
8 better and more authoritative answer from Panel 5.

9 Q. Okay. That's the end of the
10 questions on operational issues. I want to shift now
11 to environmental issues, although some of them have
12 operational issues associated with them.

13 Let me start with acid gas.

14 Ms. Ryan, earlier in this
15 cross-examination, there was some discussion of the
16 limits on economic dispatch associated with acid gas.
17 And I take it - I am not sure that I have got this
18 exactly right - but I take it that sometimes, perhaps
19 even often, Ontario Hydro has to use more expensive
20 generation rather than less in order to keep within its
21 acid gas limits; is that true.

22 MS. RYAN: A. As described by Mr.
23 Barrie, that is true, and Mr. Barrie would be better to
24 answer with respect to how we load our units.

25 Q. It is just a set-up question. I was

1 just tying it back into the old stuff.

2 And am I right in assuming that if you
3 have less hydraulic generation in a year, because of
4 low water or because of outages or whatever, that will
5 tend to increase your difficulty with meeting your acid
6 gas limits?

7 A. Depending on load requirements of the
8 year, we might have to run more fossil.

9 Q. All other things being equal, less
10 hydraulic which will generally mean more fossil and,
11 therefore, more acid gas problems, is that right, all
12 other things being equal?

13 A. More fossil, yes. I don't agree with
14 your more acid gas problems.

15 Q. Sorry. More fossil then will
16 typically make it tougher to meet the acid gas limits.
17 I am not suggesting you wouldn't meet them, simply that
18 the more you have to use fossil, the tougher it is;
19 isn't that right?

20 A. The more we use fossil, the more acid
21 gas emissions, yes.

22 MR. TABOREK: A. Our whole program is
23 developed around the recognition that our fossil
24 generation requirements can vary substantially, and so
25 we prepare from the outset to handle variations.

1 Q. If you don't get a new hydraulic
2 facility built or rehabilitated when you hope, can I
3 take it that, at least for a while, that is going to
4 increase the pressure on meeting your acid gas limits?

5 Say you had planned to have one
6 rehabilitated with an extra few hundred megawatts in
7 '94, and something happens and you can't, does that
8 mean you have more pressure on your acid gas limits?

9 MR. BARRIE: A. Any reduction in
10 hydraulic or nuclear output will tend towards causing
11 more fossil production and thereby causing more
12 emissions of acid gas.

13 Q. Now the Demand/Supply Plan has
14 several thousands megawatts, 2,000, 3,000 megawatts of
15 new hydraulic in it. I assume that if that is not
16 approved, then at least in the short term, before you
17 can get more nuclear on, you have got a pretty serious
18 acid gas process; is that right?

19 MR. SNELSON: A. You would need more
20 acid gas control measures.

21 Q. Okay. You would have to involve
22 scrubbers, say, or selective catalytic reduction
23 systems, something like that?

24 MR. TABOREK: A. I mentioned we made
25 provision to accommodate variations, and you illustrate

1 one example that would cause a variation. And one of
2 the responses we put in place for that is we received a
3 blanket environmental approval to fit up to 20
4 scrubbers on our main coal-fired plants. And by having
5 this blanket approval, what we have done is reduced the
6 lead time for the installation of scrubbers from
7 approximately 7 years to 4 years.

8 And so, in the case you mention of a
9 hydraulic station not coming on, we would have four
10 years' lead time. If we knew that four years in
11 advance, we would put a scrubber on. Well, we would go
12 through a set of analyses and a scrubber would be one
13 of the options.

14 If we had less lead time than that, we
15 would alter the sulphur content of our coal. And if we
16 had less lead time than that, we would use our energy
17 margin.

18 THE CHAIRMAN: You would use what, I'm
19 sorry?

20 MR. TABOREK: Our energy margin. We have
21 referred to a 9 terawatthour energy margin that we use
22 in our planning.

23 And then we would go on. We have, I
24 mentioned -- there, I guess, I have listed three or
25 four options, but we have perhaps half a dozen or a

1 dozen options at various times in order of cost that we
2 would use to meet the emission limits should the coal
3 burns vary.

4 MR. SHEPHERD: Q. To be fair. You would
5 have the same problem if your demand side management
6 and NUG programs didn't produce the numbers you
7 expected either, wouldn't you?

8 MR. TABOREK: A. Yes.

9 Q. You would have to take the same sorts
10 of action?

11 A. Yes, that's another source of
12 variation.

13 Q. It sounds likes coal in at least the
14 next ten years is the swing fuel. If these other
15 things don't happen, coal is the --

16 A. Near enough. Gas and oil would begin
17 to be on the margin but, yes, for your purpose you are
18 generally right.

19 Q. Now, Mr. Barrie, last week you said
20 that the major reason that you had acid gas limit
21 problems in 1990 was poor performance from nuclear
22 units; is that right?

23 MR. BARRIE: A. That's correct.

24 Q. And it is generally true that poor
25 nuclear performance will, as a side effect, put

1 pressure on your acid gas control program, generally?

2 A. Less nuclear means more fossil and
3 means more acid gas emissions.

4 MR. TABOREK: A. I think I would like to
5 say that nuclear was certainly a problem. But we had
6 just come through five or six years of load growth,
7 more than doubling our forecast, and that is cumulative
8 effect over the period. So, there were two factors and
9 our program handled both.

10 Q. Yes, I understand that. I am going
11 to get to that in a second.

12 I guess I am right then in assuming that
13 the delays in the Darlington in-service date are also
14 causing acid gas problems?

15 MR. BARRIE: A. Yes.

16 Q. I should not say causing acid gas
17 problems. Increasing the pressure on you in dealing
18 with your acid gas limits.

19 A. Yes, the delay at Darlington we now
20 projected an increased fossil burn of about 5
21 terawatthours. Sorry, take that back. The reduction
22 in Darlington is about a 5 terawatthour reduction in
23 the electricity that we expected from nuclear units.
24 That would have to be made up.

25 Q. That's for 1991?

1 A. Yes.

2 Q. Now, in 1990, you had to purchase a
3 fair bit to cover acid gas problems. Does that
4 indicate that you are going to have a similar situation
5 in '91? You may have to do some purchases?

6 A. No. Our projection right now is that
7 even taking account of the delay at Darlington, our
8 present projection is that we should be coming in
9 around 210 gigagrams compared to a limit of 280.

10 Q. Why is your number this year so much
11 lower than last year? It's a fair difference; isn't
12 it?

13 A. It is.

14 Q. You have no more nuclear or--

15 A. We do.

16 Q. --hydraulic on.

17 A. We expect more nuclear in 1991 than
18 the units that we got in 1990. I'll give you the
19 numbers if you wish.

20 Q. Oh, that's right because two
21 Darlington units will be in-service in November, and
22 December?

23 A. We have had some Darlington units
24 already. We expect some more. But that we are also
25 expecting more from Bruce than we got in 1990 and from

1 Pickering.

2 Q. I don't think we need the details. I
3 think we have got the general gist of that.

4 MR. SNELSON: A. There is another
5 factor, and that is that, in 1990, we expected to be in
6 a fairly tight situation from acid gas, because it was
7 the first year at which the regulation had been
8 lowered. '86 to '89 was a constant level and then it
9 was lowered significantly in 1990.

10 And we started a process of making a
11 significant change in the sulphur content of the fuel
12 by going to low sulphur coal, even lower than we had
13 gone to in previous years and adding flue gas
14 conditioning to enable precipitators to work on the new
15 lower sulphur coal. And we had some teething problems
16 with that system in 1990, and it is working a lot
17 better in 1991.

18 Q. Isn't it also true that Ontario is
19 right now in a middle of a recession and, as a result
20 with less economic activity, you have less load than
21 you expected?

22 MR. BARRIE: A. Less load, yes. That is
23 assisting us in meeting the acid gas, yes.

24 Q. Is that sort of a minor aspect of it
25 or is that a major impact on your ability to meet the

1 limit this year, do you think?

2 A. It is a contributory factor. I am
3 trying to make a comparison between 1990 and 1991
4 because that was the gist of your question.

5 Q. Yes.

6 A. So, although the load increase has
7 been drastically reduced, the year-on-year difference
8 between '90 and '91 in terms of the total terawatthours
9 that we expect to deliver is not all that great.

10 Q. Yes. Do you have any sense of
11 whether, but for the recession, you would still have
12 been able with the same measures to have met your acid
13 gas limit this year?

14 A. I'm confident we could have, yes.

15 MR. SNELSON: A. There is another aspect
16 of load forecast uncertainty. While the load this year
17 is less than we would have predicted it to be perhaps a
18 year or more ago, before the recession, it is probably
19 higher than it was forecast to be three or four years
20 ago, when we were making some decisions about acid gas
21 planning for 1991.

22 So, we had high load growth in '87, '88,
23 '89. And then load growth dropped off in 1990 and
24 1991, but we are still above the load that we were
25 predicting in the mid-1980s.

1 Q. 1990 was a year when your limit
2 dropped too; right?

3 A. Yes.

4 Q. So, it made it even more difficult
5 presumably.

6 A. I am just saying that we are talking
7 about load being lower than predicted, and you always
8 have to keep it in relationship to which year's
9 prediction.

10 Q. Yes.

11 A. So we are lower than we were before
12 the recession started. We are lower than we predicted
13 we would be before the recession started, immediately
14 before the recession started. But we are higher than
15 we predicted we would be at a time when we were not
16 anticipating the strong growth in load and economic
17 growth that occurred through the mid- to late 1980s.

18 Q. You went up faster than you expected
19 and then you went down when you didn't expect it, but
20 where you are now is actually higher than where you
21 expected to be in the first place?

22 A. Yes.

23 Q. That's fair.

24 Now, this may seem obvious, but if you
25 have further Darlington delays, presumably, that is

1 going to put some pressure on you this year and
2 subsequently until it comes onstream; is that correct?

3 MR. BARRIE: A. We have only studied
4 1991 in any detail. We have postulated the possibility
5 that we won't get any more Darlington in 1991, and we
6 have examined the situation to see what it would be
7 specifically with acid gas. And we will be comfortably
8 within the limit, even if we don't get any more
9 generation from Darlington this year.

10 Q. And that's with no purchases?

11 A. That's with no purchase.

12 Q. You don't have any contingency plan
13 in place to deal with the possibility that Darlington
14 might be off for two or three years before you get it?

15 A. I haven't done the analysis, so I
16 can't tell you exactly what the numbers would be. I
17 don't believe we have a specific contingency plan that
18 looks at a delay of more than what I have indicated.

19 Q. Now at the end of the year, if you
20 are close to your acid gas limit, if I am not mistaken,
21 you keep within them by either burning light oil or
22 natural gas or by purchases from other utilities? If
23 you are getting close to the top.

24 A. It is an ongoing process throughout
25 the year. I wouldn't like to just focus on the end of

1 the year. We are looking at an annual emission limit.

2 So, we have a plan which looks at the
3 whole 12 months. In fact, what we did was we made
4 purchases right at the beginning of 1990 in an attempt
5 not to get into the kind of situation that you
6 described earlier, where you are very close to the
7 limit.

8

24

25

...

1 [3:00 p.m.] So, we will use those measures I
2 described throughout the year. We are aiming to come
3 in below the legal limit.

4 Q. Now, when you purchase from other
5 utilities on that sort of basis, is that generally more
6 expensive than burning coal yourself?

7 A. Buying that amount of electricity as
8 we did, yes, it was more expensive than our own
9 coal-fired plant.

10 Q. And am I right in assuming that some
11 of those other utilities, maybe most of those other
12 utilities, often use unscrubbed coal for their
13 generation?

14 A. The purchases we made were from a
15 variety of sources, and certainly unscrubbed coal would
16 be one of them.

17 I did provide on analysis, or a
18 breakdown, of the purchases we made, in a response to
19 an interrogatory.

20 Q. I have it. We will get to it in just
21 a second. But I guess first, is it true that acid gas
22 emissions from nearby utilities often have negative
23 environmental consequences in Ontario? We talked the
24 other day about deposition and that sort of thing.

25 A. I think I said at that time I am not

1 an environmental expert, but yes, the prevailing winds
2 are in this general direction so, I would expect some
3 of it to be deposited. But I don't know how much.

4 Q. But it's clear from your previous
5 evidence, I take it, that we do include any imputed
6 acid gas emissions from the generation we purchase from
7 other jurisdictions, you don't include it in Ontario
8 Hydro's numbers?

9 A. We don't, and we don't claim credit
10 when we displace theirs either.

11 MS. RYAN: A. I think it is important to
12 point out that when we purchase power, the utilities
13 from which we are purchasing also have regulatory
14 requirements, and are, in fact, meeting those
15 requirements.

16 It's true to say that there has been a
17 discrepancy in the regulation, Ontario's regulations
18 caused to us step down first, but the at the end of
19 last year the United States passed the U.S. Clean Air
20 Act amendments, which require American utilities to
21 step down their emissions by 10,000 tons, American tons
22 by the year -- sorry, 10-million. And so, what we have
23 seen is a discrepancy for a short period of time.

24 But because, as you have indicated,
25 pollution is an international problem, there are

1 international agreements being struck to try to rectify
2 that. In fact, in March of this year, there was a
3 U.S./Canada Clean Air agreement signed between our
4 government and the American government to try and bring
5 the regulations more into line.

6 Q. So, does that mean, then, that in the
7 future, if you get into an acid gas problem, you can't
8 buy?

9 A. From what perspective, that it
10 wouldn't be able or the law would prevent it?

11 Q. Yes. Again, consider my hypothetical
12 December situation, and I understand that you don't
13 anticipate that, but consider it.

14 MR. TABOREK: A. I think the answer is
15 no, because the American utilities will take steps to
16 obey their law, and in obeying their law, there will a
17 surplus at times, as there is now with the present
18 laws. And that we will buy from them and we will sell
19 to them from our respective surpluses.

20 Q. So, even if they are regulated,
21 assuming that they are still within their limit, your
22 purchase is going to result in more total acid gas
23 emissions; isn't that correct?

24 A. Yes. Well, total...

25 MR. SNELSON: A. If their regulation

1 requires a cap on their total emissions and our
2 regulation puts a cap on our total emissions, as long
3 as we each met our own regulations, then the total
4 emissions cannot exceed the sum of the two caps.

5 MR. TABOREK: A. I balked because I
6 think I was about to be arrested for going 48 miles an
7 hour in a 50-mile-an-hour zone. We are obeying the
8 line in both countries and we are about to be charged.

9 MS. RYAN: A. In fact, setting those
10 laws has a basis, in science, to protect the
11 environment.

12 MR. TABOREK: A. Yes, you are playing
13 your own law out to us.

14 Q. I have to admit that I didn't follow
15 your analogy, but that's all right. It sounded
16 interesting.

17 Just take a hypothetical. Let us assume
18 that Michigan has a 200-gigaton limit, for argument
19 sake. I don't care what it is. Let's say it is. And
20 all other things being equal, they would be at 160 at
21 end of the year, and you have got a problem and you buy
22 some generation from them, say, 4 terawatthours. My
23 calculation is that 4 terawatthours is about 35
24 gigatons. They are still within their limit, but am I
25 wrong that somehow, in that transaction, we have 35

1 more gigatons of acid gas emissions in the air?

2 A. You have made the point there will be
3 more and I have made the point that we are both within
4 the law.

5 Q. I wasn't asking whether you were
6 complying with the law. I am asking whether your
7 purchase causes more emissions than there otherwise
8 would have been.

9 A. Yes.

10 Q. Is it true that if both of you are at
11 your limit, and you need to buy, the result is that
12 purchases are not an option for you, because you can't
13 buy from them, they would be at their limit.

14 A. Michigan is one entity.

15 MR. BARRIE: A. That's true. I think it
16 is true. In that situation, yes.

17 MR. SNELSON: A. I am not prepared to
18 buy the assumption that even if the short-term effect
19 is to increase emissions, that that is, in fact, the
20 long-term effect.

21 Q. Why is that?

22 A. Because emissions have a price
23 associated with them, which is the cost of additional
24 control. And in the U.S. system, there is considerable
25 freedom to shift emission allowances from one year to

1 another.

2 So, if a utility has used up more of its
3 emission allowance this year, because it sold energy to
4 us, that may cause them to change their acid gas
5 control program either in that year or in subsequent
6 years, so as to reduce their use of emissions
7 allowances.

8 So, for instance, they may burn more
9 natural gas in some units somewhere, instead of burning
10 coal, or they may add scrubbers to a generating plant,
11 and that may very well lead to the long-term effect
12 being no increase in emissions.

13 Q. In fact, under the U.S. Clean Air
14 Act, isn't it true that there is a system of tradeable
15 emission credits?

16 A. Yes.

17 Q. And they can, in fact, if they are at
18 their limit --

19 A. That is what I am referring to.

20 Q. So, if they are at their limit, they
21 could simply go out, put down a million dollars and
22 they have got 35 gigatons more, and they can sell that
23 to you. And all they are going to do is put it in
24 their price to you; isn't that right?

25 A. The price of the emission allowances,

1 and I am not sure that the emission allowances have
2 started trading to the point where a price has been
3 established, but the law permits that. That would be
4 one of the factors that they would build into the price
5 of electricity they send to us.

6 Q. So, the only impact, then, if I
7 understand it right, the only impact is that they
8 charge you more.

9 A. No. The impact is that they may
10 charge us more, but the price of an emission allowance,
11 because the total emissions are capped. The total
12 amount that they can emit is a physical limit. Because
13 of that, then they presumably have to somehow or
14 another reduce sulphur dioxide emissions, somehow or
15 another, to reduce their use of emission allowances
16 somewhere else.

17 It may be by the utility who is selling
18 to us, or it may be that they will buy an emission
19 allowance from somebody else who will then reduce his
20 SO(2) to create an equivalent reduction.

21 Q. Fine. Could you pick up
22 Interrogatory 2.14.68, please. This is supplementary
23 information provided in response to this interrogatory.
24 If I read this correctly -- did you say earlier, Mr.
25 Barrie, that you, in fact, wrote this?

1 MR. BARRIE: A. I did.

2 Q. If I read this correctly, the fairest
3 assessment is that if you add your purchases for acid
4 gas controls in 1990, the emissions associated with
5 them, to your actual emissions, the total emissions
6 would be 313 gigagrams?

7 DR. CONNELL: Excuse me, I haven't found
8 the interrogatory. The number again?

9 MR. SHEPHERD: Sorry. 2.14.68, Dr.
10 Connell. It should actually be the next one on the
11 pile, but if it isn't, it's one down, or a couple down.

12 THE CHAIRMAN: The figures you were just
13 reading, was that from the first page?

14 MR. SHEPHERD: It is from the second page
15 at the bottom. It's very hard to read. This is how we
16 got it, unfortunately.

17 THE CHAIRMAN: It is just the bottom of
18 the page, though.

19 MR. SHEPHERD: Right at the bottom of the
20 page, yes. 313 gigagrams.

21 MR. BARRIE: What those figures at the
22 bottom of the page say, are that our own generation
23 caused 245 gigagrams of emissions. To the best that we
24 can estimate, and I have lots and lots of ifs, ands,
25 and buts prior to that, the best we can estimate is

1 that the result of those purchases was that the
2 utilities we purchased them from would themselves have
3 emitted 68 gigagrams themselves to supply that 7.7
4 terawatthours of purchase.

5 MR. SHEPHERD: Q. And you have
6 concluded, in fact, that that is the fairest way of
7 estimating the impact of the purchases; haven't you
8 said that in here?

9 MR. BARRIE: A. I think I used the
10 words, that is our best estimate.

11 Q. Okay. Of course, now you have only
12 included in that the 7.7 terawatthours that you
13 purchased for acid gas control; right?

14 A. That is correct, yes.

15 Q. So, you haven't included the total of
16 13 terawatthours that you actually purchased?

17 THE CHAIRMAN: I'm sorry, 13 what?

18 MR. SHEPHERD: On the first page, there
19 is 13 terawatthours of total purchases in 1990. But
20 this calculation only includes the 7.7 terawatthours
21 which is part of that 13, which was specifically for
22 acid gas control.

23 Q. Isn't that correct?

24 MR. BARRIE: A. That's correct, yes.

25 Q. And, Mr. Barrie, I just did some

1 quick math and it looks to me like if you included the
2 whole 13 terawatthours then you would have a total of
3 about 360 gigagrams of total related acid gas emissions
4 in 1990.

5 A. That would be the acid gas emissions
6 by our interconnected utilities to supply 13
7 terawatthours to us.

8 Q. Yes.

9 A. If it was of the same ratio, and I
10 imagine it would be, and if I trust your arithmetic,
11 then yes.

12 THE CHAIRMAN: What was that figure
13 again, Mr. Shepherd?

14 MR. SHEPHERD: 360 gigagrams.

15 THE CHAIRMAN: 360.

16 MR. BARRIE: But, now you are adding in a
17 purchase that has nothing to do with acid gas. The
18 additional purchase we made was, in the majority,
19 because we were actually short of capacity, regardless
20 of the acid gas restrictions, and some of it, a small
21 part, was just our normal economy transactions.

22 MR. SHEPHERD: Q. Well, you say it had
23 nothing to do with acid gas, but surely it did actually
24 produce acid gas.

25 MR. BARRIE: A. It would have produced

1 acid gas.

2 What I am saying is we would have needed
3 that amount of power had there been no such thing as an
4 acid gas restriction. We were actually short of power.

5 Q. You could say the same thing about
6 every time you burn your coal units; can't you? You
7 only turn them on because you need the power, but that
8 doesn't change the fact that they produce acid gas.

9 A. Right.

10 But, if you are going to take all such
11 imports into the account, then I must reiterate that
12 most of the years we actually export, so, presumably,
13 we should subtract that from our acid gas.

14 Q. Okay.

15 THE CHAIRMAN: I'm sorry, I am confused.
16 Is the 7.7 included in the 13 or is it--

17 MR. BARRIE: Yes.

18 THE CHAIRMAN: --in addition to the 13?
19 It's included in the 13.

20 MR. BARRIE: It's included.

21 THE CHAIRMAN: Now, I thought you said in
22 the second page, that 7.7 produced 68 ggs.

23 MR. BARRIE: Gigagrams.

24 THE CHAIRMAN: And then you said the 13
25 produced 360. That can't be right.

1 MR. BARRIE: No. Mr. Shepherd did the
2 arithmetic, the total --

3 MR. SHEPHERD: The 13 actually produces
4 115, Mr. Chairman.

5 THE CHAIRMAN: Pardon?

6 MR. SHEPHERD: It produces 115, 13
7 produces 115.

8 THE CHAIRMAN: Where did I get 360 from?

9 MR. SHEPHERD: Well then, 115 plus 245,
10 which is what Hydro produced directly, is the 360
11 total.

12 THE CHAIRMAN: Okay.

13

14

15

25

...

1 [3:16 p.m.] MR. SHEPHERD: Q. And your acid gas
2 limit in 1990 was 280, wasn't it?

3 MR. BARRIE: A. Yes.

4 Q. So that if you had had to include
5 these purchases in yours, in your total, you would have
6 been almost 30 per cent over your limit, is that right,
7 roughly?

8 MS. RYAN: A. I think the answer is that
9 we don't have to include it in ours. We have a law
10 which specifically limits our emissions, and we have
11 agreements which allow us to purchase, and as Mr.
12 Barrie indicated, purchasing to meet our acid gas
13 regulation was the last thing we wanted to do.

14 Obviously, from an environmental
15 perspective, we would have preferred to meet Ontario
16 load with Ontario energy. That is what we planned to
17 do in the long run, and we couldn't. But to now change
18 the rules and say they should be added in, I don't
19 think is appropriate.

20 Q. I take it you will agree that this
21 Board could conclude that it would be a better idea if
22 we didn't export our acid gas problem to the United
23 States and still have the problem. This Board could
24 think about that a little bit.

25 MR. SNELSON: A. I think you have to

1 have a consistent set of regulations. And I am not
2 sure that we are in a position at the moment to advise
3 the Board.

4 But, just a point that should be borne in
5 mind is that if we are going to count all of the acid
6 gas that is produced in Ontario and that the Americans
7 count all of the acid gas that is produced in the
8 United States, that is one system where all the acid
9 gas produced gets counted once.

10 The other system, where all the acid gas
11 gets counted once is where you try to attribute whose
12 using the electricity and say, "Let's count all the
13 acid gas that is produced by the electricity used in
14 Ontario, no matter where it may be produced."

15 Q. That is correct.

16 A. That would require that we count in
17 our limit the acid gas for electricity that is produced
18 outside of Ontario for use in Ontario, but to avoid
19 double counting, and to be fair and equitable, it would
20 also require that the electricity that is produced in
21 Ontario and is used in the United States, be counted as
22 part of the United States' emissions and be credited
23 against Ontario Hydro's emissions.

24 Q. That sounds very sensible.

25 A. You have to do both. If you are

1 going to do one, you have to do both. And attributing
2 the acid gas to where the electricity is used, rather
3 than where it is produced, is a much more complicated
4 system to handle, and it is not the way the current
5 regulations have been framed.

6 Q. I guess, it is right that your total
7 would be the same in either case. It is just a
8 question of allocating it to various jurisdictions,
9 isn't that right, in your hypothesis?

10 A. The total would be the same, as long
11 as you counted everything and didn't double count
12 anything. Everything gets counted once. Then clearly
13 the total is going to be the same.

14 DR. CONNELL: May I ask, is there
15 somewhere in our exhibits any description of the system
16 of tradeable permits that you cited in the United
17 States?

18 MS. RYAN: It will be in the 1990 State
19 of the Environment Report that should be available by
20 the end of this month, but I don't recall anything in
21 any of the interrogatories we have answered.

22 Actually, there was one supplementary
23 document for Interrogatory 2.14.61, which was entitled
24 "The Impact on Ontario Hydro of Emissions Traded for
25 Nitrogen Oxides, A Preliminary Analysis." So if you

1 had that, it would give a background.

2 DR. CONNELL: That is just for NOx?

3 MS. RYAN: That is just for NOx. It is a
4 specific study.

5 DR. CONNELL: There is also a system for
6 total acid?

7 MS. RYAN: Yes, in Ontario and Canada, we
8 don't have it. In the U.S. Clean Air Act, they have in
9 fact set up a system for trading for SO(2).

10 DR. CONNELL: And is it regional or
11 nationwide in the United States, do you know?

12 MS. RYAN: It is nationwide.

13 DR. CONNELL: Yes. And do I understand
14 that the purpose of it, at least one of the purposes of
15 it would be to ensure that the savings in acid gas or
16 SO(2), which were most easily achievable, would be
17 accomplished first through the trading permits.

18 MS. RYAN: Easily achievable and cost
19 effective. It is based on the fact that different
20 control technologies have different marginal costs, and
21 so, you should do the cheapest ones first.

22 DR. CONNELL: Thank you.

23 MR. SHEPHERD: Q. Now, Mr. Taborek, you
24 said the other day, and I don't have the reference, but
25 I will find it if you ask me to. That 100 gigagrams of

1 acid gases, I think you actually said SO(2), wasn't
2 very much. Was that you that said that?

3 MR. TABOREK: A. That is correct. I
4 said it did not have a significant effect on the
5 environment.

6 THE CHAIRMAN: I am sorry, sir, I'm
7 afraid I didn't hear you.

8 MR. SHEPHERD: I'm sorry. I am mumbling
9 again. I apologize.

10 Q. You said that 100 gigagrams of SO(2),
11 I believe was what you said, did not have a significant
12 effect on the environment, is that correct?

13 MR. TABOREK: A. Yes.

14 Q. That is not quite half of -- well, I
15 guess it is a little over a third of your total annual
16 limit, and it still doesn't have a significant effect
17 on the environment.

18 A. Yes.

19 Q. Let me go back to the 360-gigagram
20 number for a second, because that is what I have
21 calculated all of this on.

22 Is it fair to say that the volume of acid
23 gas that is represented by 360 gigagrams is
24 approximately the area of the City of Toronto to the
25 height of a person?

1 A. I do not know.

2 Q. Does that sound the right range, or
3 do you know?

4 A. I have no idea. I'm not sure it is
5 relevant.

6 Q. Well, I'm just following up your
7 testimony that 100 gigagrams is not significant.

8 A. That is correct. I gave two reasons
9 why I felt it was so.

10 We also had provision in our regulation
11 for a period to trade amounts of that order from one
12 year to the other, to avoid getting into the kind of
13 problem that we did experience in 1990.

14 Q. Presumably because 100 is so
15 insignificant?

16 A. Because 100 is insignificant, yes.

17 Q. Well, if my example of the volume of
18 that much gas is correct, let's just assume that it is
19 for now, would you say that is an insignificant amount
20 of sulfur dioxide, pure sulfur dioxide?

21 A. Pure sulfur dioxide? I just think it
22 is totally irrelevant.

23 MS. RYAN: A. Then when it is emitted...

24 THE CHAIRMAN: I take it, you mean that
25 it is significant, or not significant?

1 MR. TABOREK: I just don't see what
2 relevance there is here. If it is 100,000 tonnes, it
3 is not significant. And how you package 100,000 tonnes
4 is irrelevant. It is 100,000 tonnes, and it is not
5 significant.

6 THE CHAIRMAN: Perhaps you could explain
7 why you say 100,000 tonnes is not significant.

8 MR. TABOREK: I did yesterday, in a
9 response to...

10 THE CHAIRMAN: I may have forgotten.

11 MR. TABOREK: I am sorry, sir.

12 There are two essential reasons. First
13 of all, officials of the Ministry of the Environment,
14 in attempting to detect the depositions that occur from
15 various sources at, I believe, two instances, took
16 measurements of acid gas depositions around Inco before
17 and after a strike. Inco emits something, roughly
18 three-quarters of a million tonnes at the time, so
19 many -- much more than 100,000 tonnes.

20 And the reason they actually did it twice
21 was because the first time that they tried to detect
22 it, they could find no difference. The second time
23 they did it, they could get barely detectible
24 differences in depositions very close to Inco for
25 changes...

1 MS. PATTERSON: When was this?

2 MR. TABOREK: This was during the early
3 '80s.

4 MS. PATTERSON: Before or after the high
5 stack?

6 MR. TABOREK: It was after the high
7 stack.

8 And so, quantities of that magnitude
9 cannot be detected.

10 Now the second...

11 THE CHAIRMAN: At what position? When
12 can't they be detected? At what point can't they be?

13 MR. TABOREK: They had a number of
14 detectors around Inco, in a wide pattern around the
15 Inco stack. They went to detect. They went
16 anticipating detecting. They were in the high
17 probability places for detection.

18 And then the second reason is that, in
19 the course of the evolution of our regulations, we had
20 it one time, it was a form of trading, but it was a
21 form of trading with ourselves from year to year called
22 banking. And there was a provision for trading 100,000
23 tonnes.

24 Now, in getting that into the regulation,
25 we discussed with the Ministry of Environment officials

1 as to whether that was environmentally acceptable. And
2 in our discussions with them, we learned that that, in
3 their view, was acceptable, or it was not a significant
4 impact. And they further testified on that basis
5 before legislative subcommittees. And now that I think
6 of it, there is actually a third reason.

7 THE CHAIRMAN: Just before you leave the
8 second, is that regulation still in place?

9 MR. TABOREK: No, it was removed.

10 THE CHAIRMAN: Why was it removed?

11 MR. TABOREK: The legislature felt it was
12 an escape valve. They liked a neat, closed regulation.

13 MS. RYAN: Mr. Shepherd...

14 THE CHAIRMAN: Just one moment.

15 MS. RYAN: I am sorry.

16 THE CHAIRMAN: You were going to say a
17 third thing.

18 MR. TABOREK: That is the essential of
19 the physics and the logic of it, sir. That the nature
20 of the acid rain phenomena is that it is a deposition
21 that occurs and accumulates over a period of years, and
22 the small amounts in one year by virtue of that are not
23 significant, similarly.

24 And you are looking at, now you have to
25 take depositions and emissions together, but you are

1 looking at something like total emissions of 20-million
2 tonnes in North America, something of that order, so
3 you are looking perturbations of 100,000 and
4 20-million, and you need multi years of that to
5 accumulate to cause a problem.

6 The obverse of the argument is that, if
7 100,000 tonnes made a big difference, the fact that we
8 have reduced by several hundred thousand tonnes by now
9 would have made marvelous improvements. And the
10 improvements that we will expect are similar gradual
11 improvements over a period of years.

12 MS. RYAN: Mr. Shepherd, if I could just
13 add one comment to significance of sulfur dioxide. The
14 reason it is difficult to envisage a blob of sulfur
15 dioxide and comment on significance is that the
16 emission, the time over which it is emitted and the
17 concentration at which it impinges whatever we are
18 talking about has a great significance on whether it is
19 considered significant. I don't think you can think of
20 it as one mass emission, because that is not how it
21 happens. It happens from a number of stacks over a
22 length of time.

23 There is an interrogatory, 2.7.73, which,
24 in fact, comments on some analyses done for our flue
25 gas desulfurization program as part of the

1 environmental assessment, and looks at total SO(2)
2 deposition in some of the more sensitive areas in
3 Ontario and analyzes how much it due to Ontario Hydro,
4 how much is due to other Canadian and other -- and U.S.
5 sources, and gives some impact for how much is being
6 deposited in each area.

7 And the analysis indicated that for the
8 Muskokas, the Ontario Hydro impact is quite small in
9 percentage. It would be about four or five per cent.

10 MR. SNELSON: So, if you completely
11 eliminated Ontario Hydro's emissions, the improvement
12 in the Muskokas would be in the order of four or five
13 per cent.

14 MR. SHEPHERD: Q. The improvement in
15 Toronto would be higher, but...

16 MR. SNELSON: A. Pardon?

17 Q. The improvement in Toronto would be
18 higher, presumably.

19 MS. RYAN: A. Not likely.

20 Q. I get the sense, from what you are
21 saying, that you are saying you are spending all this
22 money on acid gas, but it really is not very important.
23 I assume that is not what you are saying.

24 MR. TABOREK: A. No, that is not what we
25 are saying. We have spent, I think, up till now about

1 \$900-million, and we believe that we have and we will
2 spend, I believe, by the end of the year 2000,
3 something close to \$3-billion, and we believe with that
4 we will achieve marked effects in our own emissions,
5 and we believe by taking the leadership role, we have
6 assisted the federal and the provincial government's in
7 negotiating a package with the U.S. government.

...

1 [3:30 p.m.] So, we believe it is extremely important.

2 But, having said that, we have always
3 said that the money should be spent where it is
4 effective, and it should not be spent in areas that are
5 not effective, and that it should be spent where there
6 are problems and not where there are non-problems. And
7 that is very easy to do.

8 Q. Just looking at the chart that you
9 had up in your direct evidence, it looked to me like
10 your acid gas control program was one of your big
11 successes, something that you are quite proud of, that
12 you dropped them substantially. Is that a fair
13 characterization?

14 A. We have met our objectives I think.

15 MR. SHEPHERD: Mr. Chairman, do you wish
16 to take an afternoon break now?

17 THE CHAIRMAN: We will take it now.

18 MR. SHEPHERD: Mr. Chairman, could you
19 tell me whether this is a four-thirty or five o'clock
20 day?

21 THE CHAIRMAN: Well, it could be a five
22 o'clock today, if you would like it to be.

23 MR. SHEPHERD: It doesn't matter to me.

24 THE CHAIRMAN: Well, we will make it a
25 five o'clock day.

1 ---Recess at 3:32 p.m.

2 ---On resuming at 3:53 p.m.

3 THE CHAIRMAN: Go ahead, Mr. Shepherd.

4 MR. SHEPHERD: Q. I would like to follow
5 up some discussion you had with my colleague, Mr.
6 Watson, the other day.

7 As I understand it, in the same way as
8 with purchases from other utilities, when a non-utility
9 generator produces acid gases, you don't include that
10 in your totals?

11 MR. BARRIE: A. That's correct.

12 Q. During the course of Mr. Watson's
13 cross-examination, there was a whole discussion about
14 what would happen to your acid gas compliance if NUGs
15 were included in your limits. Do you recall that?

16 A. I don't actually, no.

17 Q. It was on Monday of this week. I can
18 give you the transcript references if you wish. I
19 realize a lot has gone on since then.

20 MR. SNELSON: A. If you want to ask us
21 anything specific about it, then perhaps we should see
22 the transcript.

23 Q. I am not going to refer back to that.
24 I guess I am just trying to follow on from it, the next
25 step if you like.

1 You anticipate that most of your NUGs are
2 going to be natural gas cogenerators; is that correct?

3 A. Yes, that is correct.

4 Q. If a NUG is a natural gas generator,
5 am I correct that the NOx would be less than half of
6 the NOx from the equivalent coal burning facility and
7 the SO(2) would be a very small fraction of what you
8 would have from a coal-burning facility; isn't that
9 correct?

10 A. The SO(2) would be a very small part
11 and negligible. The amount of NOx would depend on the
12 design of the cogenerator's particular facility.

13 Q. In a typical situation?

14 A. I believe we have given you some
15 typical numbers and I can't recall what they were, but
16 they would vary from situation to situation.

17 Q. They are still not close to coal.

18 A. I doubt that they would be close to
19 coal if they installed combustion turbines of good
20 modern design.

21 Q. Am I also correct that some of the
22 small amount of acid gas produced by a cogenerator, you
23 would normally expect that to be allocated to the heat
24 load as opposed to the electricity load?

25 A. You can go through an exercise of

1 allocating fuel to heat and to electricity production
2 and presumably you can go through a comparable exercise
3 with emissions.

4 Q. And, in fact, isn't it true that
5 often a NUG cogenerator will displace an existing heat
6 source; for example, a boiler or an oil boiler or a
7 diesel or even a gas boiler of some sort, and that
8 typically that will be less efficient and have a higher
9 acid gas emission than the NUG; isn't that true?

10 A. I couldn't comment on the relative
11 emissions of the old source versus the new source.

12 Q. Whatever the relative emissions are,
13 presumably some portion of the NUGs' emissions are not
14 marginal; they are not incremental to what would have
15 been the case just to supply the heat?

16 A. Presumably, if it is a case where it
17 is an existing heat load and the cogenerator is
18 replacing an existing boiler, then there is the
19 question about how much would the existing boiler have
20 emitted and relative to the new situation. And as I
21 said, I can't comment on the relative magnitude of
22 those.

23 Q. If increasing NUGs had the effect of
24 decreasing your own coal-fired generation - and just
25 accept that hypothetical, I know it is not necessarily

1 the case, but let's just accept it for now - as I
2 understand it from these discussions then, the overall
3 SO(2) and the overall NOx would go down, if you
4 displaced one for one megawatts?

5 A. That is our assumption and I believe
6 it is generally accurate.

7 Q. In fact, am I right in saying that,
8 if you just theorize for a moment, you could, say,
9 replace all of your fossil generation with NUGs, that
10 your total acid gas emissions would be well under 10
11 per cent of your current acid gas emissions?

12 A. I haven't done the calculation and it
13 is a very hypothetical situation. You have to say to
14 yourself, "Is there enough cogeneration available for
15 that to happen? Is there enough gas supply to Ontario
16 for that to happen?" So, it seems to me it is an
17 unrealistic situation.

18 Q. So, you don't even want to accept it
19 as a hypothetical?

20 A. In the real world, I don't believe
21 that this situation will occur. I mean, if you want us
22 to speculate on unreal situations, we can do that but I
23 don't know how that is useful.

24 Q. I would, in fact, like you to
25 speculate regardless of whether you think it is

1 realistic. But I take it that you can't tell me, even
2 if you do deal with that hypothetical, you can't tell
3 me what percentage your acid gas would be of the
4 displaced coal? You have no idea what the range is,
5 whether it is 10 per cent or 20 per cent or 5 per cent.
6 You just have no idea?

7 A. The calculation we are speculating
8 here is you eliminate the sulphur dioxide and you
9 may -- you know, it is quite possible that you will be
10 able to reduce the NOx somewhat. So, that gives some
11 range on the numbers but, as I say, it is quite a
12 hypothetical situation.

13 Q. And it would be a small percentage;
14 is that right?

15 MS. RYAN: A. Yes.

16 Q. Okay. Let's not try to nail it to
17 the wall.

18 Now, these figures we are throwing
19 around, those assume, I guess, that NUGs are not
20 themselves subject to controls under acid gas
21 emissions, don't they? When we are talking about a gas
22 cogenerator having less acid gas emissions, that's
23 today, right, and that's without controls, without any
24 legislated or regulated controls?

25 A. On NUGs themselves.

1 Q. Yes.

2 A. But NUGs, in fact, will meet the
3 existing environmental regulations, even though there
4 are still regulations that NUGs generators have to
5 meet, even though they don't have a cap themselves,
6 yes.

7 Q. And are you aware of any proposed
8 regulations that would require NUGs to have lower acid
9 gas emissions?

10 A. I am aware of the draft Clean Air
11 Program which, in fact, covers all industry, and NUGs
12 would be part of that, and it governs sulphur dioxide
13 and nitric oxide emissions, yes.

14 Q. Are the restrictions, is that a
15 tighter regulation allowing NUGs less SO(2) and NOx
16 than before.

17 A. Yes. Depending on current emission
18 rates and importance, it could in fact be a tighter
19 regulation for NUGs.

20 Q. Let me turn to the role of the
21 environment division. I take it that your division's
22 role is still evolving; that is, your place is still
23 evolving within your organization?

24 A. That's correct. We have been in
25 place about two years now.

1 Q. Now, your division is only indirectly
2 responsible for Ontario Hydro's environmental
3 compliance; isn't that right?

4 A. That's correct. As I pointed out in
5 my direct evidence, environmental management is the
6 responsibility of each line manager.

7 Q. Do you have any supervisory role over
8 the other divisions or the other branches in their
9 environmental compliance?

10 A. In the sense of supervisory, no.

11 Q. Your role is more as communicators or
12 facilitators?

13 A. We have a number of roles: One would
14 be to provide a focus for the environment for Ontario
15 Hydro; another would be to provide assistance to line
16 managers in helping them incorporate environmental
17 considerations into their decision-making; another
18 would be helping Ontario Hydro ensure that appropriate
19 environmental policy and procedures are in place;
20 acting as spokespersons on the environment for Ontario
21 Hydro; generally making sure things don't fall between
22 the cracks.

23 Even though we don't have direct line
24 responsibility for doing a lot of the work, there may
25 be things which, because it is not clearly one area's

1 responsibilities may need a special push to make sure
2 that it goes ahead. So, it's generally providing focus
3 for the environment for Ontario Hydro.

4 Q. In the context of environmental
5 compliance, if in the view of the environment division
6 a particular division or branch or station or whatever
7 was not doing it and it was below an acceptable
8 standard on some environmental issue, am I right that
9 you can really only either talk to them and persuade
10 them to get onside or report to senior management that
11 they are off-side. That's really all you can do.

12 A. Again compliance reporting is the
13 responsibility of line management, and it's fairly
14 clear if there are areas in non-compliance. But yes,
15 ours would be recommendatory type of input.

16 Q. Another thing that is puzzling me is
17 the relationship between the environment division and
18 the various environmental committees that Hydro has.
19 You have three environmental committees, as I
20 understand, and I am going to refer you in this context
21 to Interrogatories 2.14.43, 2.14.45, and 2.14.47. They
22 should be together in the package that I handed out.

23 A. Yes.

24 Q. And I guess this material explains
25 the committees, so I am not sure that I need you to

1 explain them again unless you want to give us a brief
2 summary of their role.

3 A. As I pointed out, since environmental
4 management is the responsibility of each line manager,
5 and Ontario Hydro is a large organization, there is
6 co-ordination required of policy issues and technical
7 environmental issues.

8 And so the environmental technical
9 committee was established as a director level committee
10 to address technical issues as outlined in the response
11 to the interrogatory.

12 The environmental policy committee is a
13 vice-presidential level committee to deal with policy
14 decisions in development that cross branches of the
15 corporation.

16 And the environment division provides
17 support to these committees to make sure they are
18 addressing the appropriate things and help get material
19 together for the meetings and draw their attention to
20 things.

21 The environmental advisory panel is
22 largely an external committee made up of environmental
23 experts to provide another source of advice to senior
24 management on environmental issues.

25 Q. Now, when I look at these three

1 committees, obviously the environment division doesn't
2 control these committees, right, these are not under
3 your auspices, you provide them with assistance?

4 A. That's correct.

5 Q. When I look at these three
6 committees, it looks to me like the committee with the
7 most direct influence over Hydro's environmental
8 policies and procedures is the environmental policy
9 committee, the committee of vice presidents.

10 A. That is correct.

11 Q. I am just looking at Interrogatory
12 2.14.45. And on the page headed up "Environment Policy
13 Committee," it says right under that "Level 2
14 Recommendatory." Can you tell me what that means?

15
16
17
18
19
20
21
22
23
24 ...
25

1 [4:07 p.m.] A. Yes, Level 2 is one level below
2 president. It goes down levels in the organization.
3 So, Level 2 is the vice-presidential level, and
4 recommendatory is that they recommend policy decisions
5 to the president for approval.

6 Q. Okay. I note that the director of
7 the environment division is the secretary to that
8 committee.

9 A. That's correct.

10 Q. I am used to public sector committees
11 where the secretary is sort of a non-participant,
12 doesn't have any voting rights, is expected to just sit
13 there and listen. Is that the case here or is this a
14 full membership on the board, on this committee?

15 A. I can't tell you about voting rights,
16 but the approvals would be by the vice-presidents who
17 make up the committee.

18 Q. In terms of settling environmental
19 policies or procedures, how are the responsibilities
20 within -- and I say that in the sense of recommending
21 them, because obviously the Board ultimately decides
22 all these things; right? But, in terms of getting to a
23 point where you have something that is going to be
24 decided upon, can you describe the division of
25 responsibilities between these committees, particularly

1 the environmental policy committee and the environment
2 division, who does what and at what level?

3 A. It would vary depending on the issue
4 or matter which was having policy developed.

5 Sometimes the environment division would
6 provide a support role to the specific line
7 organization which has responsibility for that area of
8 the environment; in fact, would do most of the work of
9 developing policy or putting forward a position.

10 For example, PCB reference plan is the
11 responsibility of the specific branch within the
12 organization and so that group does all of the work and
13 puts the information forward, but the environment
14 division provides a support role to help them.

15 In other areas, if it weren't clear that
16 one area of the organization were doing it, we might
17 take the lead role and pull the package together for
18 approval.

19 Q. I guess I am trying to get at the
20 notion of initiatives, if you will. I can picture a
21 committee of vice-presidents sitting around and saying,
22 "Well, shouldn't we be doing something about CO(2)?" I
23 am not sure that I understand correctly that that's how
24 things, initiatives in certain areas, happen at Hydro.

25 A. Okay. I think what you are talking

1 about is issue management, issue identification, and
2 CO(2) is becoming an issue that we should address and
3 how are we going to do it. That is really the role of
4 the environmental technical committee which is a
5 director level committee and has the responsibility to
6 identify, in any given year, a list of environmental
7 priorities, that either exist for the organization or
8 will exist, and ensure that a priority is assigned, and
9 that, in fact, there is a specific part of the
10 organization, whether it's a division, a department or
11 environment division, to take lead role in making sure
12 the appropriate program required is in place to address
13 it.

14 Q. Okay. My question was going to be,
15 is there any sense in which the environment division is
16 sometimes out of the loop in environmental policy
17 issues, but I take it from your answer that you're
18 right in there as part of the loop, if you like.

19 A. That's correct. The director of the
20 environment division chairs the environmental technical
21 committee and then is secretary of the environmental
22 policy committee and we are involved in that.

23 Q. Is it fair to say that there isn't
24 really any significant environmental policy development
25 going on at Hydro that the environment division isn't

1 actively involved in?

2 A. Not to my knowledge.

3 Q. In dealing with the environmental
4 policy committee, does the environment division
5 sometimes take pro-active positions attempting to get a
6 policy approved?

7 A. Yes, that is part of our role.

8 Q. I am not trying to trick you, I am
9 just sort of trying to get a sense. Is that generally
10 successful? Does the environmental policy committee
11 generally going along with the environment division?

12 A. It varies. Obviously we don't work
13 alone, we work with our colleagues in parts of the
14 organization where they have a stake in the issue at
15 hand. And certainly by the time that it would go to
16 the policy committee, there would be general consensus
17 that it was a good thing to do.

18 Q. It sounds, in fact, like a lot of
19 your division's role is sort of an informal consensus
20 building within the organization; is that fair?

21 A. To improve environmental performance
22 within Ontario Hydro, that is a large part of the job.

23 Q. Now, you have testified with some
24 pride about the - well, I shouldn't characterize it as
25 that; it sounded proud to me - to the introduction of

1 an environmental sign-off on board memos.

2 As I understood your testimony, correct
3 me if I am wrong, under this recently introduced
4 policy, certain board memos have to be reviewed with
5 environment division which can then object to them and
6 even produce a minority report.

7 You called it environmental sign-off of
8 all board memoranda for projects which have
9 environmental implications. And you went on to say,
10 this makes sure that the appropriate environmental
11 criteria or considerations have been included before it
12 goes up to the board for signature.

13 In that regard, that's right? Is that
14 correct, that that's essentially what you said to us?

15 A. Could you just read the last part?

16 Q. This a quote from page 2747 of the
17 transcript, it says:

18 "...this makes sure that the
19 appropriate environmental criteria or
20 considerations have been included before
21 it goes up to the Board for signature."

22 A. It would be to the Board for
23 approval, but generally, yes, that's what I said.

24 Q. I would like you to turn up 2.14.52.
25 I looked through this, and certainly this not referred

1 to as environmental sign-off, and correct me if I am
2 wrong, but I don't remember see anywhere where it says
3 the environment division has some sort of special
4 position or preferred position.

5 A. That's correct, because it's not just
6 an environmental sign-off; there are specific sign-offs
7 for other parts of the organization, like corporate
8 relations, law division, finance, and they were all
9 implemented at the same time.

10 Q. It looks to me like it's a policy to
11 ensure that five specified components of the
12 organization sometimes see board memos before they are
13 presented to the board; is that right?

14 A. That's correct.

15 Q. And there isn't, in fact, even a
16 requirement that the branch submitting the board memo
17 actually go to you at all, is there?

18 A. That's correct. Since environmental
19 management is a line management responsibility, the
20 vice-president going for board approval makes the
21 decision on whether or not they will go to these
22 various groups for signature. Having said that, the
23 president and the board are quite interested and have
24 specifically asked as to whether input has been
25 obtained.

1 Q. If, for example, the production
2 branch did a board memo on how to respond to the
3 nuclear moratorium, they could make a determination
4 that that was not an environmental issue and you
5 wouldn't even know about it; is that correct?

6 A. What was your example again?

7 Q. The production branch drafted,
8 prepared a memo to the board on how to respond to the
9 nuclear moratorium, what actions to take.

10 A. First of all, the production branch
11 would not do that, and secondly, the board memos which
12 have a sign-off procedure, as you pointed out, by up to
13 five various signatures, are ones which are financial
14 undertakings.

15 Q. So, it's not all board memos?

16 A. No, I didn't say all board memos. Or
17 if I didn't say it, I meant to say appropriate board
18 memos that have environmental implications.

19 THE CHAIRMAN: I guess what I would like
20 to know is who decides and how is it decided what board
21 memos have environmental implications?

22 MS. RYAN: The vice-president in charge
23 of the area which is sending the board memorandum for
24 approval is the person who decides.

25 However, if his or her decision is not

1 correct, the president or board would request a review
2 by the appropriate people, if they didn't feel the
3 appropriate inputs had been provided, and that, in
4 fact, has happened.

5 MR. SHEPHERD: Q. Now, in addition to
6 the five people who are on the list for sign-off, and
7 this is the voluntary sign-off, board memos also have
8 to go to the executive committee; do they not?

9 MS. RYAN: A. I beg your pardon?

10 Q. Don't Board memos also go to an
11 executive committee?

12 A. They go to the executive committee
13 before they go to the board.

14 Q. The executive committee includes the
15 vice-presidents of the major branches; is that right?

16 A. That's correct.

17 MR. SNELSON: A. It includes some of the
18 vice-presidents, not all of the vice-presidents.

19 Q. So, in addition to these five, they
20 also get to see it before it goes to the board?

21 MS. RYAN: A. That's correct.

22 Q. And unlike you, they have to see it
23 because they are on the executive committee. It can't
24 go to the board without going through them.

25 MR. SNELSON: A. A board memo has to go

1 to the executive committee before it goes to the board.
2 I think there may be very, very rare exceptions but
3 that's 99.95 per cent of the cases.

4 Q. Close enough.

5 A. Close enough.

6 Q. Isn't it, in fact, if you look at the
7 last page of this interrogatory, isn't it, in fact,
8 true that even Mr. Franklin says, this whole process,
9 that is the sign-off, what you refer to as the
10 environmental sign-off --

11 MS. RYAN: A. I referred to it as the
12 environmental sign-off from our perspective for what we
13 have to do. I am in environment division, we worry
14 about the environmental. I didn't mean to preclude
15 that were other sign-offs as well.

16 Q. And Mr. Franklin, in fact, says that
17 will apply, and this is not just for environment
18 division but for all of the possible sign-offs from
19 anybody, that he thinks it will apply to only a very
20 small number of board memos each month, doesn't he?
21 Doesn't he, in fact, say in that letter he thinks it
22 will only apply to two or three board memos a month?
23 Is that true?

24 A. That's what he says.

25 Q. So, if I got the impression from your

1 earlier evidence that you were saying the environment
2 division had some sort of special authority to look at
3 all board memos, I got the wrong impression, didn't I?

4 Because it's not all board memos, and it
5 is not only the environment division. So, it's not a
6 special authority at all.

7 A. It's an authority which we share with
8 others, that doesn't mean it's not special. And if I
9 said all board memos, I didn't mean all board memos. I
10 meant those with environmental implications, and that's
11 certainly what I meant to say.

12 Q. Well, sorry. Am I right in
13 understanding it's those with environmental
14 implications, that other branches have decided they
15 want to let you see, that also include a financial
16 commitment; is that right? Isn't that what you just
17 said?

18
19
20
21
22
23
24
25 ...

1 [4:22 p.m.] A. That is correct, with the further
2 qualification that should a specific vice-president
3 decide that the appropriate people did not have to see
4 it, and went forward without the sign-off authorities,
5 there is a further check by the president and the board
6 asking for that review.

7 Q. So, that is really the safety valve,
8 isn't it? The executive committee or the president or
9 the board themselves could say, "This should have gone
10 to the environment division."

11 A. That is correct.

12 Q. So, as long as they are acting
13 responsibly that way or understand the issues, you
14 don't have a problem with it slipping by you; is that
15 true?

16 A. Yes.

17 Q. Thanks.

18 MR. TABOREK: A. There is also the
19 vice-president responsible for the environmental
20 division, who is on senior committees that is also in
21 that picture.

22 Q. And who is that?

23 MS. RYAN: A. We report to the
24 vice-president of planning, and so I guess I wasn't
25 giving him appropriate credit for ensuring that board

1 memos...

2 Q. Is this the vice-president of
3 corporate planning?

4 A. Pardon?

5 Q. Is this the vice-president of
6 corporate planning?

7 A. Yes, our vice-president is corporate
8 planning.

9 MR. SNELSON: A. And he is a member of
10 the executive committee.

11 MS. RYAN: A. Executive committee.

12 Q. He's actually not even...

13 MR. SNELSON: A. He's one of the
14 vice-presidents.

15 Q. He's not even your vice-president
16 anymore, is he? I thought he was president.

17 MS. RYAN: A. But we have a
18 vice-president.

19 MR. SNELSON: A. We have an acting
20 vice-president.

21 Q. You have a new vice president?

22 A. We have an acting vice president.

23 Q. Who is that, can you tell me?

24 A. Mr. Kupcis.

25 Q. Let me turn to another area.

1 THE CHAIRMAN: Just one moment. I am
2 sorry to interrupt, but in Mr. Franklin's letter of May
3 the 23rd, one of the people who have to sign every
4 draft board memo is the director of the environment, is
5 that not right? That is what it says in the letter.
6 And on the May 23rd, 1989 letter, the first indented
7 paragraph:

8 "Along the bottom line of every draft
9 memo there will be a line listing with
10 room for initials."

11 And the last person on that list is the
12 director of the environment.

13 MS. RYAN: Yes, I think the point that
14 was being made is that whether or not this sign-off
15 sheet goes to environment division and the others on
16 the list is up to the vice-president going for
17 approval.

18 THE CHAIRMAN: It says every draft board
19 memo.

20 MR. SHEPHERD: Mr. Chairman, on the
21 previous page, the memorandum from Mr. Leonoff to the
22 vice-presidents, he says:

23 "It remains your discretions as to
24 what sign-offs you think are necessary."

25 THE CHAIRMAN: I see.

1 MR. SHEPHERD: That is where I was going
2 with that.

3 THE CHAIRMAN: So, that is a direct
4 contradiction to the letter of May the 23rd.

5 MR. SHEPHERD: That is correct.
6 I'm ready to go into another area I
7 think.

8 THE CHAIRMAN: Okay.

9 MR. SHEPHERD: That area is the area
10 of predicting changes in environmental
11 regulations.

12 Q. Mr. Taborek, you said earlier, in
13 fact, you said it a couple of times, but I will just
14 quote one time you said it.

15 "We do not know what environmental
16 rules we'll have to meet in the future.
17 We basically have been hit with a new set
18 of environmental rules roughly every two
19 years during the 1980s. We expect more."
20 And Ms. Ryan, you said on Monday:

21 "Part of the mandate --"
22 Well, actually, that is not true. Mr.
23 Watson said, and you agreed:

24 "Part of the mandate of Hydro's
25 environmental division is to attempt to

1 anticipate changes in future
2 environmental regulations and their
3 impact on Hydro's operations."

4 Do either of those quotes, are they
5 misleading of your views? Are they correct?

6 MS. RYAN: A. No, it sounds correct.

7 MR. TABOREK: A. It is correct.

8 Q. And Ms. Ryan, isn't one of the things
9 that the environment division does each year is prepare
10 a set of corporate assumptions on the environment?

11 MS. RYAN: A. We coordinate the
12 preparation of that as part of the business planning
13 process. Now, you say each year, for two years, yes.

14 Q. You have done them for '89 and '90?

15 A. That is correct.

16 Q. These are the assumptions that are
17 used in the five-year business planning cycle.

18 Is it a five-year business plan or a
19 ten-year business planning cycle?

20 A. Ten-year business planning cycle.

21 Q. Ten-year business plan. And if you
22 look at Interrogatory 2.14.61, can you just identify
23 that the five pages attached to that here are, in fact,
24 the official environmental assumptions for the business
25 plan for 1989 and '90, or '90 and '91? I don't know

1 which is -- I can't keep track.

2 A. For 1990 and '91.

3 Q. '90 and '91; is that correct?

4 They are, in fact, dated, so the first
5 three pages are the 1990 assumptions, and then the last
6 two pages are the 1991 assumptions.

7 A. Yes.

8 Q. Can you in fact confirm that these
9 are all of the environmental assumptions in the
10 business plan in each of those two years? This is the
11 full set of environmental assumptions in each year?

12 A. These are the environmental
13 assumptions that are at a level suitable for the
14 business plan and have been included in the business
15 plan. They are not all environmental assumptions that
16 might exist.

17 Q. Can you describe the purpose of these
18 assumptions?

19 A. The purpose of the assumptions is
20 that in preparing the business plans, each of the
21 branches will be planning to the same environmental
22 assumptions, and so we will have consistency in the
23 planning process from an environmental perspective.

24 These are the environmental business
25 planning assumptions. Of course, there are other

1 business planning assumptions that they would be going
2 on.

3 Q. And everybody working on the business
4 plan gets the full set of assumptions and is required
5 to follow the same consistent list, right?

6 A. Yes.

7 Q. So, the business plan is consistent.

8 A. That is correct.

9 MR. SNELSON: A. This is the submitted
10 business plan.

11 Q. That is right. This is the ten-year
12 business plan.

13 A. That is right. And why I make the
14 distinction "submitted business plan," business
15 planning assumptions are distributed early in the year,
16 so that all branches can prepare their business plans,
17 which are then combined together into a submitted
18 corporate business plan, and then that is the subject
19 of senior management review. And the approved business
20 plan may very well be different to the submitted
21 business plan.

22 Q. But, am I right that the point of
23 this assumption system is to make sure that, at least,
24 the process starts consistent?

25 A. Yes.

1 MS. RYAN: A. Yes.

2 Q. When you do that set of assumptions,
3 do I take it correctly, you get a lot of input from
4 other parts of Hydro, you analyze that, perhaps even
5 you get some draft assumptions from people, and you
6 sort of put it all together to a single set of
7 assumptions from all that input?

8 A. We get input from a number of places
9 and compile it, yes.

10 Q. And all parts of the organization are
11 required to use these assumptions in the business
12 planning process, except for at the top approval level,
13 where they are not required to do anything; is that
14 correct?

15 A. These are the assumptions that are to
16 be followed by all branches in preparing their business
17 plans.

18 Q. So, does that include the people in
19 the organization projecting costs? You have people in
20 the organization projecting future costs; is that
21 right?

22 A. Again, it would be those parts of the
23 organizations, where it is appropriate that they
24 incorporate environmental -- where the assumptions have
25 some meaning to their area of the business.

1 Q. Of course, they only have to follow
2 the assumption if it is relevant to what they are
3 doing, right?

4 A. That is correct.

5 Q. But if it is, they do have to follow
6 it.

7 A. Yes.

8 Q. And, Mr. Snelson, I presume this
9 applies to the assistant planners as well. That you
10 are expected to follow the same set of assumptions in
11 your involvement in the business plan?

12 MR. SNELSON: A. Yes.

13 Q. What about the forecasters, the load
14 forecasters? Are they also required to follow those
15 assumptions.

16 A. I'm not sure which parts of the
17 environmental assumptions would impact on their
18 forecast, and presuming that they had some impact, then
19 it would be a factor they would take into account. But
20 at the time of the business planning assumptions, the
21 load forecast has already been set.

22 So, by the time the business planning
23 assumptions are produced in February each year, one of
24 the other business planning assumptions is to use the
25 load forecast that was developed the previous December.

1 Q. Well, that sounds like it is sort of
2 circular, almost for everybody. That is, everybody has
3 to input their assumptions, including the load
4 forecast, but everybody is required to use everybody
5 else's assumptions. It doesn't sound like you could
6 get it in order.

7 A. When you actually come to the
8 practicality of it, because the load forecast has been
9 set at this particular time, then the load forecast is
10 not going to be changed, at least in the preparation of
11 the submitted business plans request through the
12 business planning process.

13 So, the environmental assumptions that
14 are used in business planning are unlikely to -- well,
15 there is no way that they can affect the load forecast
16 of that round of business planning, unless it is
17 brought in later, as an adjustment, in the senior
18 management review.

19 Q. Now, there is, I guess, at any given
20 time when the load forecasters are doing the load
21 forecast, there is a current set of environmental
22 assumptions in effect; is there not?

23 A. There will be whatever is the set of
24 assumptions and business plans and so on that are in
25 effect at the time that Mr. Burke is preparing his load

1 forecast.

2 Q. So, they might be a few months old,
3 but they would still be there?

4 A. Yes. I'm not sure that I am the
5 right person to be testifying how Mr. Burke takes
6 environmental assumptions into account in his load
7 forecast.

8 Q. I didn't ask that question.

9 A. I have no detail on that sort of...

10 Q. Mr. Snelson, I have not asked how
11 they would take them into account. I have asked
12 whether are they required to. Everybody else is. Are
13 the load forecasters required to use these assumptions?

14 A. The load forecasters are required to
15 produce the best load forecast they can with all the
16 information that is available to them. How they go
17 about doing that is something Mr. Burke can tell you
18 about, and I can't.

19 Q. Are there any other parts of the
20 organization that in the business planning process are
21 not required to follow these environmental assumptions?
22 I take it you are saying the load forecasters are not
23 required to follow these assumptions.

24 MR. TABOREK: A. No, that is not...

25 THE CHAIRMAN: I don't think he went that

1 far. At least I didn't hear him go that far.

2 MR. TABOREK: That is not quite right,
3 because the way it works, the load forecast is produced
4 first, then the assumptions are produced, then the
5 business plan is prepared, and then there is another
6 load forecast, and they use the assumptions that have
7 been valid up to that time. It is a cyclical and
8 iterative process. So, they are using environmental
9 assumptions.

10 They obviously can't use the ones that
11 are going to be produced a month or two after they do
12 their load forecast, but they use the ones just before.

13 THE CHAIRMAN: Are you saying, Mr.
14 Taborek, that the forecasters then have to use the
15 assumptions that have been in place? Is that what you
16 are saying?

17 MR. TABOREK: And their knowledge of
18 events in the corporation to adjust those, yes, is my
19 understanding.

20 THE CHAIRMAN: I'm not sure what you mean
21 by the knowledge of events in the corporation.

22 MR. TABOREK: Well, if they know that
23 there is a major difference being proposed, then they
24 would be aware of that, or was going to be proposed,
25 then that would be in their thinking.

1 MR. SHEPHERD: Q. So, I take it then,
2 Mr. Taborek, that for example when Mr. Burke is doing
3 the 1990 load forecast, which comes out in the spring
4 of 1991, or late 1990, I don't know, I have never been
5 able to figure that out, that he would be using then
6 the set of environmental assumptions that we are here
7 dated March 1, 1990, plus any further information he
8 had as to evolution of those assumptions, after the
9 set.

10 MR. TABOREK: A. That is my
11 understanding, yes.

12 Q. And is that, Ms. Ryan, -- I
13 understand it to be that there is a rule that you have
14 to follow the same consistent set of assumptions, is
15 that right?

16 MS. RYAN: A. That is correct.

17 Q. Is that a rule that the forecasters
18 are required to do that, or is there an exception for
19 them?

20 MR. SNELSON: A. The load forecasters
21 produce the best in focus they can with all the
22 information that is available to them.

23 THE CHAIRMAN: That is not responsive to
24 the question, with great respect.

25 MR. SNELSON: I don't know of any rule

that is written down that says what they have to include in their load forecast and what they do not have to include in their load forecast.

MR. SHEPHERD: Q. Is there a rule that everyone else has to follow the same set of assumptions for the business plans?

MR. SNELSON: A. The business plan is prepared in the manner which we have described.

...

1 [4:37 p.m.] Q. I said everyone else, Mr. Snelson.
2 The question requires just a yes or a no. There is a
3 rule or there is not a rule.

4 A. The business planning assumptions are
5 issued in February for all those groups who have to
6 prepare business plans to prepare their submitted
7 business plans. The load forecast is one of the
8 assumptions in that set of business planning
9 assumptions.

10 The load forecast has not changed as part
11 of the process of going from business planning
12 assumptions to a submitted business plan.

13 The business planning assumptions only
14 have life during that time period. You then have the
15 question of what is the approved business plan as a
16 result of whatever modifications are made to the
17 submitted business plan. And the approved business
18 plan and any other information available to them would
19 be taken into account in the load forecast.

20 But the business planning assumptions
21 have one purpose, and that is to allow the organization
22 on as consistent a basis as we can to move from a
23 period in February where we try and get everybody in
24 line with a fixed set of assumptions to prepare a
25 consistent set of submitted business plans.

1 Q. I am obviously having a hard time
2 making myself clear.

3 Forget the load forecast, please. We
4 will come back to it later. Just forget it. Just deal
5 with everybody else. There is a set of assumptions
6 prepared?

7 A. Yes.

8 Q. What is in them doesn't matter.
9 There is a set?

10 A. Yes.

11 Q. Is there a rule that says that
12 everybody who does a business plan after that point in
13 time for their division must follow that set of
14 assumptions?

15 A. The set of assumptions are --

16 Q. Excuse me, Mr. Snelson --

17 A. No.

18 Q. It is a yes/no question. You can
19 then qualify it afterwards if you wish.

20 A. The set of assumptions are
21 distributed to the organization --

22 Q. Excuse me. Mr. Chairman, I am having
23 a hard time getting a straight answer here.

24 THE CHAIRMAN: I think you could answer
25 the question yes or no and then expand on it if you

1 wish.

2 Is there a rule that requires people to
3 adhere to these assumptions?

4 MR. SNELSON: There is a memo from the
5 president instructing people to follow those
6 instructions. And if that's a rule in your sense, that
7 is a rule. And that's the explanation I was trying to
8 give.

9 MR. SHEPHERD: Fair enough. Okay.

10 Q. But because the load forecast - now
11 we are getting back to the load forecast - because the
12 load forecast is part of those assumptions, the load
13 forecasters can't follow them because they are
14 chronologically prior in the process; correct?

15 MR. SNELSON: A. Yes. In preparing
16 their load forecast, they are chronologically prior to
17 the forecast. They are actually required to follow
18 those assumptions in preparing their own input to their
19 business plan about their own costs and staffing and so
20 on for their own unit.

21 Q. But not in preparing their load
22 forecast?

23 A. Not when preparing their load
24 forecast, though it is possible that the load forecast
25 may be changed as part of a subsequent review of the

1 business plans.

2 Q. All right. But you have said, Mr.
3 Taborek, that although there is no rule that says they
4 have to follow them, in fact, in practice they will
5 follow the previous set and update them.

6 MR. TABOREK: A. And with their
7 knowledge. That leads to the point Mr. Snelson made
8 that if by some chance they should end up with an
9 incompatible business plan -- load forecast, I am sure
10 it would be adjusted.

11 Q. Now, Ms. Ryan, the forecasters, in
12 fact, in Panel 1 testified -- they were asked
13 extensively about how they make their assumptions,
14 especially on environmental issues, and what they said
15 is they make their own assumptions. They didn't refer
16 to your assumptions at all. Did you know that?

17 MS. RYAN: A. Not explicitly, no.
18 What sort of environmental assumptions do
19 you mean for them?

20 Q. I am not sure I understand your
21 question?

22 MR. SNELSON: A. I don't think we are
23 familiar with the testimony that you are referring to
24 from the load forecast group. Maybe it would help us
25 if we could see what they have said and that would help

1 in interpreting whether it was consistent or
2 inconsistent with the evidence that we have given you.

3 Q. There is quite a number of
4 references - that is why I didn't give you the list -
5 because it was talked about for a long time.

6 A. It is very hard to comment on what
7 they have said without seeing what they have said and
8 in what context.

9 Q. If we have to pursue that in detail,
10 I will give you the list of references. I think that's
11 fair.

12 When you do these assumptions you are not
13 just "blue-skying" it, you are not just saying, "Well,
14 I think something might happen in the future, that's my
15 sense, that's my feel." You are using quite hard data
16 to do that, aren't you, to give the assumptions?

17 MS. RYAN: A. Yes.

18 Q. Specific knowledge of specific
19 proposals?

20 A. Our knowledge would be based on draft
21 regulations that are either already on the table or we
22 know are coming, or consultation processes with
23 government and industry to discuss future regulation or
24 future direction, and also seeing what is happening in
25 other jurisdictions.

1 So, there would be a reasonable
2 probability of the types of things that you see here
3 happening. And actually, in a lot of cases, it is more
4 than a reasonable probability; we know specifically
5 that regulations will be kicking in on specific dates.

6 Q. So, if you just think, sort of your
7 own knowledge of the trend in a particular area, say
8 CO(2), if you just think that there is going to be
9 tighter regulation, that doesn't go in the assumptions
10 unless you have some specific consultation process or
11 some specific proposals from the government?

12 A. No, that's not correct.

13 But the less sure we are of either the
14 timing or the level to which there would be regulation
15 or change required, the less specific the assumption
16 would be.

17 With respect to CO(2), we would indicate
18 that there was a need to look at potential for CO(2)
19 reductions in the future or there are many aspects to
20 looking at a problem, not just control equipment to do
21 it. There is a lot of front-end work in research and
22 development and design work in feasibility studies that
23 can be done to lead up to it. So, we would try to
24 encompass both types.

25 Q. I am just trying to make sure I

1 understand this here. You are constantly talking to
2 governments - federal, provincial, municipal,
3 sometimes, presumably - and other stakeholders, about
4 changes in environmental regulations, isn't that true,
5 Ms. Ryan? It is an important part of what you do in
6 the environment division?

7 A. Yes.

8 Q. And you could simply get a sense that
9 there is a direction that is going to happen. I assume
10 that if you just have a sense and nothing more
11 specific, that you are not going to put an assumption
12 in your business planning assumptions.

13 A. It would depend on the specific sense
14 and area.

15 Q. On the other side, if there is a
16 specific government proposal on the table for a
17 regulation and in your view after negotiation it will
18 be softened, would you typically put as the assumption
19 the softer version that you expect to come into place?

20 A. Can you be more specific? I mean my
21 answer to that is "not necessarily."

22 Q. Let's say there was -- well, you
23 have, in fact, I think said -- let me see if I can find
24 one. I am sure there was one in here. No, it might
25 take me a few minutes to find that. I will leave that

1 for now.

2 Now, am I right in assuming that for the
3 purposes of its 10-year business planning, Hydro only
4 looks at, through your assumptions process, only looks
5 at existing regulations and at proposed regulations
6 that have a high likelihood of being enacted, as you
7 would not put in your assumptions either a proposal
8 that you thought wasn't going to make it or something
9 that was not proposed unless you knew it was likely to
10 be, very likely to be?

11
12
13
14
15
16
17
18
19
20
21
22
23
24
25 ...

1 [4:50 p.m.] A. To go into the business planning
2 assumptions to be costed as a business plan, there
3 would have to be a reasonable probability that it would
4 happen. However, we can cover-off the more improbable
5 types of things with research and development and
6 design studies, without having the operating parts of
7 the business, having to physically put money in a
8 budget for control technology. I mean, there are
9 lead-ups to knowing what alternatives might be
10 available should one of the less probable assumptions
11 happen.

12 MR. SNELSON: A. The corporation may
13 also make allowances in its financial planning for the
14 cost of things which are not yet known about, some of
15 which might be the costs of meeting additional
16 environmental regulation.

17 So, in the financial planning, they have
18 the capability, if they feel that it is desirable - and
19 this would be subject to direction from senior
20 management - to put into the projections of future
21 costs, unidentified costs to cover -- to allow a
22 contingency to cover unforeseen, things that are
23 presently unforeseen and unidentified, and additional
24 costs due to environmental regulation could be part of
25 that.

1 Q. Those would be decisions made by the
2 financial analyst, not by people directly related to
3 environmental regulation?

4 A. It's decisions that would be made at
5 quite a high level in the corporation, and I would
6 expect vice-presidents, if not the president, to be
7 involved in those sorts of decisions. They would be
8 incorporated into the financial projection by an
9 analyst but the analyst wouldn't make the decision.

10 Q. Is this something that the
11 environmental policy committee might do, is make a
12 suggestion that some sort of contingency be taken for
13 something you don't know about but might happen?

14 MS. RYAN: A. Not to my knowledge.

15 Q. Mr. Snelson, is that sort of what you
16 were driving at, that it would have to be at that sort
17 of level that the suggestion was made?

18 MR. SNELSON: A. It would probably be
19 something that was proposed from within the finance
20 branch or the corporate planning branch and would be
21 approved by the executive committee or the senior
22 management committee with the president present.

23 So, it would be decided at a very high
24 level in the corporation involving vice-presidents, but
25 it might very well not be the environmental policy

1 committee where the decision was made. I am saying,
2 the allowances that I am talking about are to cover a
3 wide variety of cost uncertainties that the corporation
4 faces and they are not just necessarily environmental
5 cost uncertainties.

6 Q. Ms. Ryan, would you agree that proper
7 planning, especially long-term planning, requires not
8 just that you plan to meet current regulations or even
9 proposed regulations, or even ones that you know about,
10 but that you should be taking into account trends and
11 possible future environmental regulation and controls
12 in the planning; would you agree with that?

13 MS. RYAN: A. For long-term planning,
14 yes, you should take into account future requirements.

15 Q. And in taking into account the future
16 requirements, would you agree that you should not limit
17 yourself to the things you know about right now, that
18 you should look beyond those?

19 A. Are you talking from a technology
20 point of view or an environmental concern point of
21 view?

22 Q. Both.

23 A. To the extent that you are able to
24 with your present knowledge base, yes.

25 Q. Does that mean that if, because of

1 lack of knowledge, you may think there is a trend to
2 tighter regulation in a certain area, but you don't
3 have enough knowledge to really know that that's going
4 to happen, that you should not include that in your
5 planning exercise for long-term planning?

6 A. I think your planning exercise has to
7 hold in it enough alternatives to cover a number of
8 eventualities.

9 Q. Sort of a flexibility in the
10 planning?

11 A. Because the one thing you know, that
12 what you know now, and what you are planning for, will
13 probably not be reality when you get there.

14 So, I agree that you have to anticipate
15 to the extent that you can and accommodate alternatives
16 to meet the requirements.

17 Q. Do you believe - do "you" believe -
18 that -- before I get to that.

19 Mr. Snelson, you are the planner, in
20 fact. Do you agree with the statement I made about
21 planning, that you should take into account not only
22 existing proposed and known future regulations, but
23 also possible future regulations that you don't know
24 about yet?

25 MR. SNELSON: A. It is important to have

1 flexibility in plans to accommodate a wide range of
2 possible futures and changes in regulations is one of
3 the potential future changes which we try to retain
4 flexibility in our plans to accommodate.

5 Q. Ms. Ryan, do you believe that within
6 the next 25 years there will be substantial regulation
7 of CO(2)?

8 MS. RYAN: A. I am not sure what form it
9 will take, but yes, I think there will be a move to
10 limit or reduce CO(2).

11 Q. And do you think it will be
12 significant?

13 A. Can you define "significant"?

14 Q. Pick your own definition.

15 MR. TABOREK: A. But don't tell us!

16 Q. Just tell us what it is. I don't
17 want to get into one of these discussions again about
18 what is significant.

19 MS. RYAN: A. You can't define
20 significant just by one parameter, because there are so
21 many things that could cause it to be more or less
22 significant when you get there.

23 Q. Some of the limits that have been
24 talked about, the standing-pat position where we stay
25 at the same as, what is it, 1988, that's one of the

1 proposals that has been made?

2 A. I believe it's stability at 90 levels
3 or reduction of 88 levels by the year...

4 Q. Reduction of 88 levels by 20 per
5 cent, that's one of the other proposals?

6 A. Yes.

7 Q. And there have been proposals of
8 carbon taxes or emissions credits to meet that sort of
9 target?

10 A. There are many thoughts on how to do
11 it.

12 Q. Which include those examples?

13 A. Yes.

14 Q. And would it be fair to say, if
15 anything like those sorts of limits were put in place
16 with the sorts of proposals that have been made to get
17 there, that they would have significant impact on
18 Hydro's activities?

19 A. I guess it depends on our future
20 generation mix.

21 MR. SNELSON: A. If you have read
22 Exhibit 40, you will see that we have done an
23 evaluation of some broad-brush thinking about what
24 CO(2) limits might mean for the electricity system, and
25 because of the uncertainties that Ms. Ryan referred to

1 in her testimony as to the how carbon dioxide
2 regulations would be implemented, if they were
3 implemented, and I believe I heard Mr. Burke testifying
4 to the uncertainties as to how that would affect the
5 load for electricity, if at all, that the broad-brush
6 treatment in Exhibit 40 is appropriate, I believe.

7 Q. And what is the conclusion of that
8 report, just generally?

9 A. The report looks at the consequences
10 of various implications of CO(2) and comes to the
11 conclusion that a number of the directions that we are
12 going to in our planning are directionally in the right
13 direction for a situation where carbon dioxide might be
14 limited.

15 Q. Haven't you said, Mr. Snelson, in the
16 Demand/Supply Plan, that at the present time there is
17 no economic way of reducing CO(2) emissions from fossil
18 generation?

19 A. We said there is no economic way of
20 removing carbon dioxide from the waste gas stream of
21 fossil fuel generation.

22 Q. That was stated by you in the
23 Demand/Supply Plan; isn't that right?

24 A. I believe we have said that. I
25 believe it to be true.

1 Q. So, the current plan, to the extent
2 that it continues to include fossil, am I right in
3 assuming that it does not take into account the
4 potential for significant CO(2) regulation?

5 A. The current plan compares our carbon
6 dioxide emissions to a 20 per cent reduction by the
7 year 2005 as an illustrative target as a potential
8 measure of whether or not we are in the direction of
9 reducing carbon dioxide by that amount.

1 [4:58 p.m.] Q. Just one more question on 2.14.61.
2 Only answer it if you have a quick answer, otherwise,
3 you can answer on Monday morning.

4 In the original answer to 2.14.61, you
5 said, and that is on the first page of this, before the
6 supplementary material, you said:

7 "Predicting the outcome of such
8 consultations,"

9 that is, future regulations,

10 "or specific documentation on the
11 development of regulations is not
12 relevant to the Demand/Supply Plan."

13 Can you explain what you mean by that?

14 MS. RYAN: A. I believe, it meant that
15 the options available in the Demand/Supply Plan covered
16 a wide range of alternatives for the future, and that
17 to predict specific numbers, which could be met by that
18 range of alternatives, was not relevant to provide. We
19 did subsequently provide you with the assumptions.

20 Q. Yes, of course. Would you agree that
21 the testing, whether in various potential futures your
22 plan is flexible enough to cover, say, different types
23 of environmental regulations, is part of what we are
24 doing here?

25 A. Certainly, this process is looking at

1 the plan in the broadest sense, and how it will meet
2 the needs of the province, yes.

3 MR. SHEPHARD: Mr. Chairman, this might
4 be a good time to adjourn for the weekend, if that is
5 convenient.

6 THE CHAIRMAN: All right. We will
7 adjourn now until Monday morning at 10:00 o'clock.

8
9
10
11 ---Whereupon, the hearing was adjourned at 5:01 p.m.,
12 to be resumed Monday, June 3, 1991, at 10:00 a.m.
